Balancing and Sequencing of Assembly Lines Armin Scholl, 1999-02-26 The book deals with two main decision problems which arise when flow line production systems are installed and operated The assembly line balancing problem consists of partitioning the work necessary to assemble the products among different stations of an assembly line If several models of a product are jointly processed on a line this medium term problem is connected with the short term problem of determining an operating sequence of the models In Part I balancing and sequencing problems are discussed classified and arranged within a hierarchical planning system In the present second edition special emphasis is given to u shaped assembly lines which are important components of modern just in time production systems Part II is concerned with exact and heuristic procedures for solving those decision problems For each problem type considered a survey of existing procedures is given and new efficient solution methods are developed Comprehensive numerical investigations showing the effectiveness of the new methods and their superiority over existing approaches are reported

Assembly Line Rebalancing with Non-constant Task Time Attribute Yuchen Li,2016 Assembly line has been widely used in producing complex items such as automobiles and other transportation equipment household appliances and electronic goods Assembly line balancing is to maximize the efficiency of the assembly line so that the optimal production rate or optimal length of the line is obtained Since the 1950s there has been a plethora of research studies focusing on the methodologies for assembly line balancing Methods and algorithms were developed to balance an assembly line which is operated by human workers in a fast and efficient fashion However more and more assembly lines are incorporating automation in the design of the line and in that case the line balancing problem structure is altered For these automated assembly lines novel algorithms are provided in this dissertation to efficiently solve the automated line balancing problem when the assembly line includes learning automata Recent studies show that the task time can be improved during production due to machine learning which gives the opportunities to rebalance the assembly line as the improvements occur and are observed The concept of assembly line rebalancing or task reassignment are crucial for the assembly which is designed for small volume production because of the demand variation and rapid innovation of new product In this dissertation two forms of rebalancing are provided forward planning and real time adjustment The first one is to develop a planning schedule before production begins given the task time improvement is deterministic The second one is to rebalance the line after the improvements are realized given the task time improvement is random Algorithms address one sided and two sided assembly lines are proposed Computation experiments are performed in order to test the performance of the novel algorithms and empirically validate the merit of improvement of production statistics *Proceedings of the 13th International Conference on Production Research* E. M. Dar-El,Reuven Karni,Yale T. Herer,1995 **The Management of Manufacturing** Edward J. Anderson,1994 This text sets out to demonstrate the types of models and analysis necessary to solve problems in production management It focuses on the flow of material through the manufacturing process and provides a balanced up to date account of the fundamentals **International journal of production economics** ,2003 Robotics Today ,1983 **The Design of the Factory with a Future** J.
