A Real-Time Implementation of License Plate Recognition (LPR) System Santosh Kumar Sahoo, 2018-03-07 Master s Thesis from the year 2010 in the subject Engineering Computer Engineering grade A Gandhi Institute of Engineering and Technology language English abstract With increasing number of population and higher rate of development the problem of road accident is also increasing rapidly So the basic concept is to develop a model that can be useful as a security system in the society and can monitoring the vehicle speed A License Plate Recognition LPR System is one kind of an Intelligent Transport monitoring System and is of considerable interest because of its potential applications in highway electronic toll collection and traffic monitoring systems This type of applications puts high demands on the reliability of an LPR System A lot of work has been done regarding LPR systems for Korean Chinese European and US license plates that generated many commercial products However little work has been done for Indian license plate recognition systems The purpose of this thesis was to develop a real time application which recognizes license plates from cars at a gate for example at the entrance of a parking area or a border crossing The system based on regular PC with video camera catches video frames which include a visible car license plate and processes them Once a license plate is detected its digits are recognized displayed on the User Interface or checked against a database The focus is on the design of algorithms used for extracting the license plate from a single image isolating the characters of the plate and identifying the individual characters The proposed system has been implemented using Vision Assistant 7 1 and LabVIEW 7 1 The performance of the system has been investigated on real images of about 100 vehicles The recognition of

about 98% vehicles shows that the system is quite efficient

Car License Plate Detection Naikur Bharatkumar Gohil, California State University, Sacramento, 2010 In last couple of decades the number of vehicles has increased drastically With this increase it is becoming difficult to keep track of each vehicle for purpose of law enforcement and traffic management License Plate Recognition is used increasingly nowadays for automatic toll collection maintaining traffic activities and law enforcement Many techniques have been proposed for plate detection each having its own advantages and disadvantages The basic step in License Plate Detection is localization of number plate The approach mentioned in this project is a histogram based approach This approach has an advantage of being simple and thus faster Initially license plate localization is implemented using MATLAB and verified for its functionality Once the functionality is verified the algorithm is implemented on EVM320DM6437 Texas Instrument TI Digital Video Development Starter Kit DVDSK By implementing this algorithm on a kit we eliminate need of computers and thus think of portable implementation of such application In this approach a digital camera is used to capture video and feed it to the kit The kit processes each frame individually and provides the coordinates of location with maximum probability of having a number plate Later this information is used for recognizing actual number of the license plate The plate detection algorithm is implemented in C compiled and debugged using Code Composer Studio CCS an IDE provided by TI Successful demonstrations were given by downloading the algorithm onto TI's EVM320DM6437 DVDSK

[License Plate Recognition Through Neural Networks](#) Olivia Halma, 2023 License plate recognition software has been around since the 1970s However the world of computer vision has been getting new developments almost every year Next Generation Security Concepts Inc 2023 The new revolutionary advances in computer vision technology have made tasks like license plate recognition much more streamlined and accessible By using a mixture of pre made algorithms and personally curated neural networks a license plate recognition program was made To accomplish this a large data set of American plates was required Since there is no freely accessible database with suitable photographs a more manual approach had to be taken The data set that was collected contains around 900 images of cars from mainly Missouri but other states are represented as well The next critical step in the process was to retrain a YOLO You Only Look Once v8 model The model already had a pre trained license plate class however it was not trained on the dimensions of American plates Therefore a re training process was

required to achieve a higher level of detection After the training was completed the next goal was to build a convolutional neural network that takes the cropped characters as inputs and outputs the predictions This technology comes with security and ethical concerns as well On the security side access to the database where information is stored and who has access to it is something to be discussed On the ethical side the prospect of mass surveillance is deeply concerning to many people All of these topics will be discussed in depth throughout the paper

Car License Plate Recognition Using Template Matching Algorithm Pramod S. Kapadia, California State University, Sacramento, 2010 License Plate Recognition or LPR is an image processing technology used to identify vehicles by their license plates This technology is used in various applications involving security traffic law enforcement public safety and transportation sectors It mainly uses software code that enables computer systems to read automatically the registration number license number of vehicles from digital pictures The project explains various algorithms that are exercised to recognize the characters present on the California Car License Plate One of them is Template Matching algorithm that has an

ability to store the information of a particular size template in the form of four 16 bit vectors and apply it for recognizing the characters This feature of the algorithm mentioned above helped in achieving faster character recognition of the license plate This process of character recognition consists of steps like Image processing Defragmentation Resizing and Character localization that are required to be performed on the image in order for Template Matching to be done The final goal of the project was to simulate these algorithms initially on Microsoft Visual Studio using Open CV libraries Once this was established the design was transferred on the TI s video development platform DM6437 DVDP for testing and performance analysis The earlier mentioned algorithmic steps were written in C programming language and demonstration of the project was successfully presented on the TI s DSP board EVM320DM6437
