

MULTIPLE SCLEROSIS GETTING ON YOUR NERVES?

Participate in MS Research!

About the Study

Multiple sclerosis (MS) is a condition in which body's immune system targets and damages the protective covering (myelin) surrounding nerve fibers which disrupts communication between the brain and the body, potentially resulting in long-term nerve fiber impairment.

Revive Research Institute is conducting a study that aims to explore the safety and efficacy of potential new treatment for MS patients who have not had a relapse in the past year.

Participate now to make a difference!

Participation Criteria:

- Male & females aged 18 to 65 years
- Diagnosed with Multiple Sclerosis
- No relapse reported within 6 months prior

**Additional criteria may apply*

Why Participate?

- Enhanced care by expert physicians
- May gain access to novel therapies
- Contribute to advancing treatments
- May receive compensation for time and travel

such as whole genome sequencing and advanced bioinformatics analysis have promoted the research of pathogenic microorganisms. However, with the interplay of multiple factors like global climate change, ecological and environmental changes, urbanization, social behavior, and lifestyle changes, pathogenic microorganisms' transmission patterns and impact scope are gradually changing. There is an urgent need for multidimensional technological approaches to achieve epidemiological monitoring and evolutionary direction prediction of pathogenic microorganisms. Additionally, more robust data processing and analysis capabilities are required for rapid identification and diagnosis, monitoring of drug resistance, development of antimicrobial drugs and vaccines, and optimization of treatment plans. Therefore, Artificial Intelligence (AI) has entered our field of vision. In the field of pathogenic microorganisms, AI has shown tremendous potential. In epidemiological research, AI technology can quickly and automatically collect, integrate, and analyze the epidemic data of infectious diseases from different regions so as to predict the trend and scope of disease transmission and track the source of infection. In the process of diagnosis and treatment of infectious diseases, machine learning can not only analyze the microscopic images of pathogens but also analyze the genome sequences of multiple pathogens in a short time and predict their sensitivity or resistance to specific antibiotics, greatly improving the efficiency and accuracy of diagnosis and treatment of infectious diseases. In drug or vaccine development, researchers can use AI models to predict efficient antigens for diseases such as HIV and influenza and thus design more effective vaccine candidates. AI models can also analyze the interactions between drugs, pathogens, and patients in order to design the optimal dosing regimen for each patient. In a word, AI can help human beings better deal with infectious diseases. We welcome original reviews, articles, and other contributions in related fields which mainly include the following aspects: 1. The application of AI in the differential diagnosis of pathogenic microorganisms; 2. The application of AI in the formulation of anti-infection treatment plans; 3. The application of AI in monitoring and predicting the prevalence of pathogenic microorganisms; 4. Application of AI in the prediction and prevention of infectious diseases caused by pathogenic microorganisms; 5. The application of AI in the research and development of anti-infective drugs and vaccines.

Neuro-Immune Interactions in Inflammation and Autoimmunity Valentin A. Pavlov, Niccolo Terrando, 2018-07-24. The nervous system plays an important role in the regulation of immunity and inflammation. On the other hand, unbalanced immune responses in inflammatory and autoimmune conditions may have a deleterious impact on neuronal integrity and brain function. Recent studies have characterized neural pathways communicating peripheral inflammatory signals to the CNS and brain and spinal cord-derived circuitries controlling various innate and adaptive immune responses and inflammation. A prototypical neural reflex circuit that regulates immunity and inflammation is the vagus nerve-based inflammatory reflex. Ongoing research has revealed cellular and molecular mechanisms underlying these neural circuits and indicated new therapeutic approaches in inflammatory and autoimmune disorders. Pharmacological and bioelectronic modulation of neural circuitry has been successfully explored in preclinical settings of sepsis, arthritis, inflammatory bowel

disease obesity driven disorders diabetes and other diseases These studies paved the way to successful clinical trials with bioelectronic neuronal modulation in rheumatoid arthritis and inflammatory bowel disease Dysregulated release of cytokines and other inflammatory molecules may have a severe impact on brain function Brain inflammation neuroinflammation imbalances in brain neuronal integrity and neurotransmitter systems and cognitive impairment are characteristic features of post operative conditions sepsis liver diseases diabetes and other disorders characterized by immune and metabolic dysregulation Derangements in cytokine release also play a pivotal role in depression Characteristic brain reactive antibodies in autoimmune conditions including systemic lupus erythematosus and neuromyelitis optica significantly contribute to brain pathology and cognitive impairment These studies and the simultaneous characterization of neuro protective cytokines identified new therapeutic approaches for treating neurological complications in inflammatory and autoimmune disorders This Frontiers Research Topic is a forum for publishing research findings and methodological and conceptual advances at the intersection of immunology and neuroscience We hope that presenting new insight into bi directional neuro immune communication in inflammation and autoimmunity will foster further collaborations and facilitate the development of new efficient therapeutic strategies
