control sliding mode control time delayed control variables structure control robust adaptive control fuzzy logic control chaos hyperchaos jerk systems hyperjerk systems chaos control chaos synchronization etc Special importance was given to chapters offering practical solutions modeling and novel control methods for the recent research problems in nonlinear control systems This book will serve as a reference book for graduate students and researchers with a basic knowledge of electrical and control systems engineering The resulting design procedures on the nonlinear control systems are emphasized using MATLAB software

Nonlinear Control in the Year 2000 Alberto Isidori, Françoise Lamnabhi-Lagarrigue, Witold Respondek, 2000-11-17 Control of nonlinear systems one of the most active research areas in control theory has always been a domain of natural convergence of research interests in applied mathematics and control engineering The theory has developed from the early phase of its history when the basic tool was essentially only the Lyapunov second method to the present day where the mathematics ranges from differential geometry calculus of variations ordinary and partial differential equations functional analysis abstract algebra and stochastic processes while the applications to advanced engineering design span a wide variety of topics which include nonlinear controllability and observability optimal control state estimation stability and stabilization feedback equivalence motion planning noninteracting control disturbance attenuation asymptotic tracking The reader will find in the book methods and results which cover a wide variety of problems starting from pure mathematics like recent fundamental results on non-analyticity of small balls and the distance function through its applications to all just mentioned topics of nonlinear control up to industrial applications of nonlinear control algorithms

Nonlinear Control and Filtering Using Differential Flatness Approaches Gerasimos G. Rigatos, 2015-06-25 This monograph presents recent advances in differential flatness theory and analyzes its use for nonlinear control and estimation It shows how differential flatness theory can provide solutions to complicated control problems such as those appearing in highly nonlinear multivariable systems and distributed parameter systems Furthermore it shows that differential flatness theory makes it possible to perform filtering and state estimation for a wide class of nonlinear dynamical systems and provides several descriptive test cases The book focuses on the design of nonlinear adaptive controllers and nonlinear filters using exact linearization based on differential flatness theory The adaptive controllers obtained can be applied to a wide class of nonlinear systems with unknown dynamics and assure reliable functioning of the control loop under uncertainty and varying operating conditions The filters obtained outperform other nonlinear filters in terms of accuracy of estimation and computation speed The book presents a series of application examples to confirm the efficiency of the proposed nonlinear filtering and adaptive control schemes for various electromechanical systems These include industrial robots mobile robots and autonomous vehicles electric power generation electric motors and actuators power electronics internal combustion engines distributed parameter systems and communication systems Differential Flatness Approaches to Nonlinear Control and Filtering will be a useful reference for academic researchers studying advanced problems in nonlinear control and

nonlinear dynamics and for engineers working on control applications in electromechanical systems *Towards Constructive Nonlinear Control Systems Analysis and Design* Mario Sassano, David Angeli, Alessandro Astolfi, 2012 This work presents a novel method to solve analysis and design problems for nonlinear control systems the classical solutions of which rely on the solvability or on the solution itself of partial differential equations or inequalities The first part of the thesis is dedicated to the analysis of nonlinear systems The notion of Dynamic Lyapunov function is introduced These functions allow to study stability properties of equilibrium points similarly to standard Lyapunov functions In the former however a positive definite function is combined with a dynamical system that render Dynamic Lyapunov functions easier to construct than Lyapunov functions These ideas are then extended to characterize Dynamic Controllability and Observability functions which are exploited in the model reduction problem for nonlinear systems Constructive solutions to the L2 disturbance attenuation and the optimal control problems are proposed in the second part of the thesis The key aspect of these solutions is the definition of Dynamic Value functions that generalizing Dynamic Lyapunov functions consist of a dynamical feedback and a positive definite function In the last part of the thesis a similar approach is utilized to simplify the observer design problem via the Immersion and Invariance technique Finally the effectiveness of the methodologies is illustrated by means of several applications including range estimation and the optimal robust control of mechanical systems combustion engine test benches and the air path of a diesel engine
