An Assessment of the Communications Technology Laboratory at the National Institute of Standards and Technology
National Academies of Sciences, Engineering, and Medicine, Division on Engineering and Physical Sciences, Laboratory Assessments Board, Panel on Review of the National Institute of Standards and Technology's Communications Technology Laboratory, 2019-12-03

An Assessment of the Communications Technology Laboratory at the National Institute of Standards and Technology Fiscal Year 2019 is an independent technical assessment of the quality of the National Institute of Standards and Technology's NIST's Communications Technology Laboratory CTL. It reviews the organization's technical programs, the portfolio of scientific expertise within the organization, the adequacy of the organization's facilities, equipment, and human resources, and the effectiveness by which the organization disseminates its program outputs. This report focuses on CTL priority areas such as public safety communications, trusted spectrum, testing, and Next Generation Wireless 5G and Beyond. It also assesses the extent to which CTL applied the recommendations from a 2015 National Academies report which describes many of the critical uses of radio communications, provides lab-specific recommendations, and highlights important research priorities for the Boulder, Colorado, communications technology laboratory of the Department of Commerce laboratory. This new report also describes the current activities of the Boulder telecommunications laboratories, its strengths and weaknesses as an organization, and its plans for the near future.

Characterizing LTE User Equipment Emissions Jason Coder, 2019

Characterizations of long-term evolution (LTE) user equipment (UE) emissions are a key ingredient in models of interference between wireless cellular networks and other systems that must use the same radio frequency spectrum. This report presents i) a laboratory test methodology for measuring LTE UE emissions under a wide range of conditions, and ii) the results of a factor screening experiment involving 28 factors (e.g., evolved node B (eNB) power control variables, eNB scheduling algorithms, network loading, traffic type) that aimed to determine which factors have a significant impact on physical uplink shared channel (PUSCH) power per physical resource block (PRB). The results given here demonstrate the validity of the proposed test methodology and illustrate how factor screening experiments can be used to better understand the emissions of typical commercial off-the-shelf LTE UEs.

LTE Handset Emissions Robert D. Horansky, 2019

This report describes work that measured the three-dimensional emission patterns for a variety of user equipment (UE) handset devices operating on long-term evolution (LTE) protocols. This effort was part of a National Advanced Spectrum and Communication Test Network (NASCTN) project sponsored by the Defense Spectrum Organization (DSO) to investigate the factors that influence aggregate LTE UE emissions in the advanced wireless service 3 (AWS-3) band and the sensitivity of the emissions to those factors. The work presented in this technical note supported the NASCTN's Aggregate LTE Characterizing UE Emissions project outcomes by ensuring the best orientation and associated uncertainty for transmission was known for each UE tested. Due to the potential benefit to the broader spectrum community, this work is being released as a stand-alone technical report as well.
