Methodological and Biostatistical Foundations of Clinical Neuropsychology and Medical and Health Disciplines Domenic V Cicchetti, Byron P Rourke, 2004-06-01 The goal of the second edition is to introduce the advance undergraduate or graduate student and more seasoned research scientists in any of the allied health sciences to a wide array of methodological and

biostatistical issues as they occur in the context of both published and ongoing research. Some sixty-four articles published between 1992 and 2002 have been selected from the *Journal of Clinical and Experimental Neuropsychology*, *The Clinical Neuropsychologist*, and *Child Neuropsychology* and reproduced in this volume. While building upon a working knowledge and understanding of the basic univariate data analytic techniques and the research designs to which they apply, the approach to the more complex multivariate techniques is presented primarily at a conceptual and essentially non-mathematical level. While the issue of the complexity of some of the more recent and standard approaches to data analytic strategies and their important role to specific research designs is important to convey, there remains an even more fundamental issue of whether the results of correctly applied data analytic strategies make any practical or clinical sense above and beyond their having reached levels of statistical significance. These critical issues are addressed throughout various commentaries that the editors make at appropriate points in the text. The volume will appeal to advanced undergraduate and graduate students as well as clinical neuropsychologists and research scientists in any of the allied health disciplines.

Provides a fully updated resource with more color illustrations. Focuses on the biochemical and molecular basis of disease as well as the analytical techniques. Defines important differences in the pathophysiology of diseases comparing childhood with adult.

Regression Methods for Medical Research Bee Choo Tai, David Machin, 2013-10-09 *Regression Methods for Medical Research* provides medical researchers with the skills they need to critically read and interpret research using more advanced statistical methods. The statistical requirements of interpreting and publishing in medical journals together with rapid changes in science and technology increasingly demands an understanding of more complex and sophisticated analytic procedures. The text explains the application of statistical models to a wide variety of practical medical investigative studies and clinical trials. Regression methods are used to appropriately answer the key design questions posed and in so doing take due account of any effects of potentially influencing co-variables. It begins with a revision of basic statistical concepts followed by a gentle introduction to the principles of statistical modelling. The various methods of modelling are covered in a non-technical manner so that the principles can be more easily applied in everyday practice. A chapter contrasting regression modelling with a regression tree approach is included. The emphasis is on the understanding and the application of concepts and methods. Data drawn from published studies are used to exemplify statistical concepts throughout. *Regression Methods for Medical Research* is especially designed for clinicians, public health and environmental health professionals, para-medical research professionals, scientists, laboratory-based researchers and

students *Quality of Life Outcomes in Clinical Trials and Health-Care Evaluation* Stephen J.
