Convolutional Neural Network in classifying scanned documents Tai Doan, 2016-12-30 Internship Report from the year 2016 in the subject Computer Science Applied University of Science and Technology of Hanoi course Internship language English abstract In this project I created and augmented a dataset from a number of given images to train and test convolutional neural network which is used to classify five classes of images of scanned documents In order to generate the dataset some image processing techniques were applied such as

sliding window rotating flipping and pyramid sizing The result of this phase is a set of images having same size 244x224x3 These images after being labeled were divided into three dataset for training validating and testing the network The network is a simple convolution neural network which is also called LeNet It has three convolutional layers and one fully connected layer After being trained and validated the best state of the network was pointed out and tested on the testing dataset and some real images The result showed that the LeNet was able to classify images of documents in a pretty high accuracy At the end of the project I modified the network and discussed the affect that those changes had on the network with the purpose of creating another similar network which can perform better than the original one The result proved that it worked a little better than its original version

The usage of FPGAs for the acceleration of Convolutional Neuronal Nets (CNNs) with OpenCL. Two alternatives for implementation Christian Lienen,2019-01-09 Seminar paper from the year 2018 in the subject Engineering Computer Engineering grade 1 0 University of Paderborn language English abstract Convolutional Neuronal Nets CNNs are state of the art Neuronal Networks which are used in many fields like video analysis face detection or image classification Due to high requirements regarding computational resources and memory bandwidth CNNs are mainly executed on special accelerator hardware which is more powerful and energy efficient than general purpose processors This

paper will give an overview of the usage of FPGAs for the acceleration of computation intensive CNNs with OpenCL proposing two different implementation alternatives The first approach is based on nested loops which are inspired by the mathematical formula of multidimensional convolutions The second strategy transforms the computational problem into a matrix multiplication problem on the fly The approaches are followed by common optimization techniques used for FPGA designs based on high level synthesis HLS Afterwards the proposed implementations are compared to a CNN implementation on an Intel Xeon CPU in order to demonstrate the advantages in terms of performance and energy efficiency
