

Costal Engineering

Costal Engineering is a branch of civil engineering that deals with the design and construction of structures and systems that are exposed to the forces of the sea. This includes the design of harbours, piers, breakwaters, and coastal defences. It also involves the study of coastal erosion and the development of strategies to protect the coastline.

The main objective of costal engineering is to provide a safe and secure environment for the coastal population and to protect the natural resources of the coast. This is achieved by designing structures that can withstand the forces of the sea and by implementing measures to prevent coastal erosion. The design of costal structures is a complex task that requires a deep understanding of the forces of the sea and the materials used in their construction.

Costal engineering is a highly specialised field that requires a combination of technical skills and a deep understanding of the coastal environment. It is a challenging and rewarding profession that offers the opportunity to make a significant contribution to the protection and development of the coast.
