Quadrotor Modeling And Control:

Dynamic Modeling and Control of a Quadrotor Using Linear and Nonlinear Approaches Heba talla Mohamed Nabil Elkholy, American University in Cairo. School of Engineering Interdisciplinary Program, 2014 Abstract With the huge advancements in miniature sensors actuators and processors depending mainly on the Micro and Nano Electro Mechanical Systems MEMS NEMS many researches are now focusing on developing miniature flying vehicles to be used in both research and commercial applications This thesis work presents a detailed mathematical model for a Vertical Takeoff and Landing VTOL type Unmanned Aerial Vehicle UAV known as the quadrotor The nonlinear dynamic model of the quadrotor is formulated using the Newton Euler method the formulated model is detailed including aerodynamic effects and rotor dynamics that are omitted in many literature The motion of the quadrotor can be divided into two subsystems a rotational subsystem attitude and heading and a translational subsystem altitude and x and y motion Although the quadrotor is a 6 DOF underactuated system the derived rotational subsystem is fully actuated while the translational subsystem is underactuated The derivation of the mathematical model is followed by the development of four control approaches to control the altitude attitude heading and position of the quadrotor in space The first approach is based on the linear Proportional Derivative Integral PID controller The second control approach is based on the nonlinear Sliding Mode Controller SMC The third developed controller is a nonlinear Backstepping controller while the fourth is a Gain Scheduling based PID controller The parameters and gains of the forementioned controllers were tuned using Genetic Algorithm GA technique to improve the systems dynamic response Simulation based experiments were conducted to evaluate and compare the performance of the four developed control techniques in terms of dynamic performance stability and the effect of possible disturbances

Modeling and Control Simulation for Autonomous Quadrotor Idris Eko Putro, 2011-03 The use of Quadrotor UAVs has been widely well known It has capability to hover vertical take off and landing VTOL with having less complexity in vehicle dynamics compared with small helicopter It is basically an unstable system and exhibits nonlinear behavior This book describes the development of nonlinear model of quadrotor dynamics derived from Newton Euler formulation and presented under Matlab Simulink environment The Model is equipped by Stability Augmentation System SAS to maintain the quadrotor level flight attitude stability The autonomous mission for this vehicle is fixed for trajectory following LQR Optimal control was chosen to accomplish this mission

Modeling and Control of a Quadrotor in a Wind Field Nguyen Khoi Tran, 2016 In recent years there has been a surge of interest in the use of small unmanned air vehicles UAVs for various civilian and military applications Many of the proposed applications are outdoor and may include environments with high wind The relatively small size of quadrotors means that wind gusts can destabilize the quadrotor if the on board flight controller is not equipped to deal with wind effects This work investigates the ability of a quadrotor to maneuver in a wind field and develops a method to cope with wind disturbances A dynamic model of a quadrotor is presented to model its motion The quadrotor model

includes a wind effect model to quantify the effect of wind on the dynamics of a quadrotor A proportional integral derivative PID controller is shown as a baseline controller typically used on quadrotors A LQR controller is then shown as an alternative to a PID controller These two controllers are compared in a simulation environment using the wind effect model and simulated wind disturbances Both controllers are found to have similar performance in a wind field though the LQR controller is found to be easier to tune These experiments were then repeated using the AscTec Pelican quadrotor platform in an indoor environment A feedforward controller was developed which uses the wind effect model and a custom onboard wind sensor to generate control inputs that oppose the disturbance forces and moments In simulation the feedforward controller was effective in improving control performance while experimentally the feedforward control was not effective due to wind sensing errors

Modeling and Control of a Quadrotor with Dynamic Inertia Jared D. A. Becker, 2013 As the support and technology for unmanned vehicles has increased so have the possible applications for Unmanned Aerial Vehicles UAVs From military intelligence gathering missions to civilian search and rescue missions the demand for highly capable UAVs is high Drawing inspiration from biological examples such as the hawkmoth this research investigates the use of dynamic inertia as a control mechanism for small quadrotor helicopters Using Lagrangian mechanics a nonlinear 3D model and a nonlinear 2D model are developed for a quadrotor with dynamic inertia modeled as an actuated pendulum mounted beneath the vehicle Designing a linear quadratic controller for a linearization of the system about the hovering flight condition and applying this controller to the nonlinear model results in a stabilizing dynamic inertia controller capable of adequate trajectory tracking for a simple desired trajectory Additional simulations also show that the linear controller has favorable robustness properties to compensate for modeling errors and nonlinearities
