process These methods are known as FORM and SORM First and Second Order Reliability Methods respectively Monte Carlo methods which require repeated calls of the numerical normally finite element solver of the structural model using a random realization of the basic variable set x each time In the first category of methods only SORM can be considered of a wide applicability However it requires the knowledge of the first and second derivatives of the performance function whose calculation in several dimensions either implies a high computational effort when faced with finite difference techniques or special programs when using perturbation techniques which nevertheless require the use of large matrices in their computations In order to simplify this task use has been proposed of techniques that can be regarded as variants of the Response Surface Method

Structural Reliability Analysis and Seismic Risk Assessment, 1984 This paper presents a reliability analysis method for safety evaluation of nuclear structures By utilizing this method it is possible to estimate the limit state probability in the lifetime of structures and to generate analytically the fragility curves for PRA studies The earthquake ground acceleration in this approach is represented by a segment of stationary Gaussian process with a zero mean and a Kanai Tajimi Spectrum All possible seismic hazard at a site represented by a hazard curve is also taken into consideration Furthermore the limit state of a structure is analytically defined and the corresponding limit state surface is then established Finally the fragility curve is generated and the limit state probability is evaluated In this paper using a realistic reinforced concrete containment as an example results of the reliability analysis of the containment subjected to dead load live load and ground earthquake acceleration are presented and a fragility curve for PRA studies is also constructed
