

Costal Engineering

Costal Engineering is a branch of civil engineering that deals with the design and construction of structures and systems that are exposed to the coastal environment. This includes the design of coastal defense structures, such as sea walls, dunes, and levees, as well as the design of coastal infrastructure, such as roads, bridges, and buildings. The field also encompasses the study of coastal erosion and the impact of sea level rise on coastal communities.

The coastal environment is a complex and dynamic system, and coastal engineering must take into account a wide range of factors, including wave action, storm surges, and sediment transport. Coastal engineers use a variety of tools and techniques, including computer modeling, field measurements, and laboratory experiments, to study coastal processes and design effective coastal defense systems. The field is a rapidly growing area of research and practice, as coastal communities around the world face increasing threats from sea level rise and coastal erosion.
