Object Classification, Detection and State Estimation Using YOLO V3 Deep Neural Network and Sensor Fusion of Stereo Camera and LiDAR Kamalkumar Bharatkumar Mehta, 2022 Real time object classification localization and detection with region based convolution neural network R CNN require high computational power or it consumes a tremendous amount of time with the use of the available on board computer system Therefore either of those ways is not practical in real time object detection In contrast the YOLO v3 network which stands for you only look once that uses the YOLO algorithm seems to

be practical in live object classification localization and detection since the YOLO algorithm seems to work faster than the sliding window algorithm used by R CNN Sensor fusion in this context requires estimation and association of information coming from more than one optical sensor that improves the accuracy in locating the object in the real world The goal of this research is to implement a real time object detection and tracking algorithm for a collision avoidance application in an autonomous ground vehicle Transfer learning was performed to train the pre trained artificial neural network YOLO v3 that uses a supervised learning algorithm and a labeled dataset was created to train the deep neural network Hyper parameters such as mini batch size L2 regularization parameter number of epochs and learning rate were tuned to study the trade off between the bias and variance of a classifier to improve the performance of the neural network Moreover the intrinsic calibration of the stereo camera and LiDAR was performed to find standard measurement error by re projecting the measurement data on ground truth data Similarly the extrinsic calibration was done to derive standard transformation error between these two optical sensors Finally the object s states were fed to the centralized sensor fusion framework which uses a linear Kalman filter to estimate the states of the objects The complete framework was developed in MATLAB 2020b by use of deep learning computer vision and image processing LiDAR and sensor fusion and tracking toolboxes The experimental platform was equipped with two single pin hole cameras with Sony IMX 179 optical sensor Intel Real sense L515 LiDAR camera and Intel NUC as an on board processing unit Four 3d shapes cylinder cone pyramid and rectangular parallelopiped were used to train the neural network for object detection The driving scenario designer tool from MATLAB 2020b was used to simulate a driving scene and further use to test the sensor fusion framework

Performance and Accuracy Analysis in Object Detection Guei-Sian Peng,2019 We analyze the efficiency of the state of the art object detection systems that have recently been introduced for fast and accurate object detection in images video streams and real time videos We implemented and analyzed the efficiency of YOLOv2 YOLOv3 and SSD object detection systems In this project we introduce the functionality of these 3 systems the metrics to evaluate the efficiency of object detection algorithms and present the results of our implementations for small scale datasets We also present an efficiency analysis of these three systems for large scale datasets Object detection is an intelligent computer vision technique similar to our humans visions for locating instances of objects in images video or real time surveillance It has been researched for several years and has been improved to an unprecedented level It also has been adopted across our daily lives from our cellphones video surveillance and object tracking to pedestrian recognition and so forth There are various detection models such as Region Proposals R CNN Fast R CNN Faster R CNN You Only Look Once YOLO Single Shot MultiBox Detector SSD etc We studied the most recent and most efficient systems YOLOv2 YOLOv3 and SSD YOLOv3 and SSD are considered the best methods with the highest accuracy and fastest speed that can be achieved in object detection in images and video streams We also studied the efficiency of all three systems for real time object detections The results demonstrated that YOLOv3 is the most accurate but slowest object

detection system while SSD is the fastest one with the lowest accuracy YOLOv2 has a lower accuracy than YOLOv3 but it is faster For object detection in recorded images and videos YOLOv3 is the best one since it detects the objects with the highest accuracy however for real time video streams SSD provides the best one since it is the fastest one Since there is a trade off between accuracy and speed in all these systems the most appropriate system for each application depends on the application requirements NAVOKAR Jaabaaal Shah,2021 The You only look once v4 YOLOv4 is currently one of the leading state of the art models for real time object detection The YOLOv4 tiny is proposed based on YOLOv4 to simplify the network structure and reduce parameters which makes it be suitable for developing on the mobile and embedded devices To improve the accuracy of object detection a fast object detection method is proposed based on YOLOv4 tiny and VGG Net First we implement the mosaic data augmentation and Mish activation function to increase the generalization ability of the proposed model making it more robust Secondly it enhances the richness of the features extracted by simply adding one extra 3x3 convolution layer in such a manner that two consecutive 3x3 convolutions are used to obtain 5x5 receptive fields to extract global features in the first CSP block and restructuring the connections of the subsequent layers to have the same effect on the next CSP blocks Simulation results show that the proposed model has almost similar performance and memory footprint but significantly higher accuracy than YOLOv4 tiny It is more suitable for real time object detection especially for implementation on embedded devices **Real-Time Object Measurement and Classification** Anil K.
