Analysis Of Multivariate Survival Data:

Analysis of Multivariate Survival Data Philip Hougaard,2012-12-06 Survival data or more general time to event data occur in many areas including medicine biology engineering economics and demography but previously standard methods have requested that all time variables are univariate and independent This book extends the field by allowing for multivariate times Applications where such data appear are survival of twins survival of married couples and families time to failure of right and left kidney for diabetic patients life history data with time to outbreak of disease complications and death recurrent episodes of diseases and cross over studies with time responses As the field is rather new the concepts and the possible types of data are described in detail and basic aspects of how dependence can appear in such data is discussed Four different approaches to the analysis of such data are presented The multi state models where a life history is described as the subject moving from state to state is the most classical approach The Markov models make up an important special case but it is also described how easily more general models are set up and analyzed Frailty models which are random effects models for survival data made a second approach extending from the most simple shared frailty models which are considered in detail to models with more complicated dependence structures over individuals or over time Marginal modelling has become a popular approach to evaluate the effect of explanatory factors in the presence of dependence but without having specified a statistical model for the dependence Finally the completely non parametric approach to bivariate censored survival data is described This book is aimed at investigators who need to analyze multivariate survival data but due to its focus on the concepts and the modelling aspects it is also useful for persons interested in such data but

Multivariate Survival Analysis and Competing Risks Martin J. Crowder,2012-04-17 Multivariate Survival Analysis and Competing Risks introduces univariate survival analysis and extends it to the multivariate case It covers competing risks and counting processes and provides many real world examples exercises and R code The text discusses survival data survival distributions frailty models parametric methods multivariate *Biostatistical Genetics and Genetic Epidemiology* Robert C. Elston,Jane M. Olson,Lyle Palmer,2002-04-22 Human Genetics concerns the study of genetic forces in man By studying our genetic make up we are able to understand more about our heritage and evolution Some of the original and most significant research in genetics centred around the study of the genetics of complex diseases genetic epidemiology This is the third in a highly successful series of books based on articles from the Encyclopedia of Biostatistics This volume will be a timely and comprehensive reference for a subject that has seen a recent explosion of interest following the completion of the first draft of the Human Genome Mapping Project The editors have updated the articles from the Human Genetics section of the EoB have adapted other articles to give them a genetic feel and have included a number of newly commissioned articles to ensure the work is comprehensive and provides a self contained reference

Univariate and Multivariate Survival Models with Flexible Hazard Functions Dooti Roy, 2017

Our research focuses on exploring and developing flexible Bayesian methodologies to model both univariate and multivariate survival data When developing a Bayesian survival model the most desirable properties are often flexibility of hazard functions a proper posterior distribution and efficient implementation The novelty of our work can be classified into three sections first we introduce a new distribution to model univariate and bivariate survival data Although extreme value theory and subsequently the Generalized Extreme Value GEV distribution have been explored in the past to model rare events our work is the first of its kind to extend GEV framework into the foray of survival analysis We develop a cure rate model and apply it to various types of univariate cancer survival data Second we provide a novel method of estimating the copula association parameter for bivariate survival data using an empirical Bayes approach Lastly we propose a novel Bayesian R Vine approach to model multivariate survival data The thesis consists of five chapters Chapter 1 introduces the problem of survival data analysis and provides a brief overview of both the frequentist and Bayesian methods developed over the past few decades Chapter 2 briefly introduces the univariate extreme value analysis In Chapter 3 we use both forms of the GEV distribution the Maxima and the Minima to develop a Bayesian modeling technique to analyze right censored log survival data for populations with a surviving fraction Next in Chapter 4 we consider bivariate survival data and use copula structures to model the association between the survival times A novel empirical Bayesian method for estimating the copula function has been proposed Using our model we enable the user to use different copula functions to model the same data and hence introduce the concept of copula choice using the Bayesian model selection approach We demonstrate through extensive simulations that the empirical Bayesian approach provides tighter HPD intervals for the copula parameter of association as compared to full Bayesian and two stage estimation procedures Lastly chapter 5 introduces a novel approach to model multivariate survival data using a Bayesian R vine copula approach We show that this method provides flexibility and easy computation even for dimensions 3 and higher as compared to direct extension of bivariate copula families to multivariate dimensions
