

Best Practices and HPC Strategies for Ansys Mechanical

Challenges

Business requires low-cost, quickly completed structural simulation. Modeling complex geometries, capturing nonlinear material behavior, and ensuring accurate boundary conditions often are tedious, costly, and error-prone tasks. These challenges can be mitigated with the following strategies and efficient modeling tools – all of which are covered in this presentation.

In addition, engineers increasingly need to simulate a wide range of complex structural forms, and fast business cycles, adding other constraints to models. This talk will discuss design automation and scripting to speed simulation and help address any specific business

requirements. The other leading challenge is performance. Scaling HPC resources across multiple simulation cases and quickly reconfiguring jobs without reparameterizing HPC usage requires a change in how design teams set up their workflow. Further, flexibility to access more design iterations, to conduct analysis on lower fidelity, or to analyze one through and through is essential.

Finally, using HPC resources flexibly may require an extension to design modeling and engineering tools to overcome structural differences across simulation types.
