Centrosomes in Development and Disease Erich A. Nigg,2006-01-24 Discovered over a century ago the centrosome is the major microtubule organizing center of the animal cell It is a tiny organelle of surprising structural complexity Over the last

few years our understanding of the structure and composition of centrosomes has greatly advanced and the demonstration of frequent centrosome anomalies in most common human tumors has sparked additional interest in the role of this organelle in a broader scientific community The centrosome controls the number and distribution of microtubules a major element of the cell cytoskeleton and hence influences many important cellular functions and properties These include cell shape polarity and motility as well as the intracellular transport and positioning of various organelles Of particular interest centrosome function is critical for chromosome segregation and cell division This book is meant to summarize our current knowledge of the structure function and evolution of microtubule organizing centers primarily centrosomes Emphasis is on the role of these organelles in development and disease particularly cancer
