**Blockchain-based Digital Twins. Requirements and Design Decisions for the Data Storage** Tobias Heinrich,2023-01-12 Master s Thesis from the year 2022 in the subject Computer Science Miscellaneous University of Hohenheim language English abstract The following research goal is the development of design decisions for the blockchain based storage of digital twin data The digital twin can be deployed in almost every industry and is able to represent any object being process or organisation The resulting benefits are versatile and can encompass a higher transparency and efficiency cost reduction or the enabling of completely new functions such as the virtual commissioning Digital twins do even contribute to a sustainable industrial production as they enable a corresponding reduction of the primary energy emissions of up to eight percent Due to this substantial added value digital twins pertain to the top ten strategic technology trends and are expected to reach a market size of over 48 billion USD by 2026 The existence of digital twins is strongly dependent on its underlying data for which reason the data storage is of fundamental importance for the operation of this technology In the past the digital twin concept mostly relied upon a traditional storage infrastructure in form of databases or clouds However digital twins and its data storage face major challenges e g through a more and more connected world and therefore an increasing number of potential participants and data volume or as a consequence of growing data security related risks Furthermore potential digital twin use cases entail varying conditions for which reason alternative storage solutions must be assessed The blockchain technology might constitute a possible alternative to realize the storage of digital twin data Through the novel and nearly unique characteristics such as immutability decentralisation or manipulation safety blockchains could introduce new opportunities to address digital twin use cases Those characteristics seem relevant at first sight as the application areas of digital twins become more manifold especially as the digital twin concept evolves from a descriptive to a rather actionable approach and include more critical data How the blockchain technology can actually deal with the requirements for the data storage including the abovementioned challenges must therefore be evaluated in order to facilitate their interplay and potentially achieve their full potential Hereby at first the data storage in digital twins must be understood comprehensively to assess the suitability of their deployment

Gender Gap in Blockchain Systems Amanda Van Annan,2025-10-14 Master s Thesis from the year 2024 in the subject Computer Science Internet New Technologies grade 1 5 course MBA language English abstract Blockchain focuses on using digital systems to execute and record online transactions that can only be perceived or considered as the building blocks developed from digital algorithms and secured through cryptography This technology system is one of the key strategic technology trends used in various organizations or public sectors to record transactions The problem at hand is the gender gap within the blockchain

industry where African American women are underrepresented and face various challenges in their pursuit of opportunities and advancement. Despite the increasing interest in blockchain technology, the participation of women in the industry remains significantly lower compared to their male counterparts. This gender disparity not only limits the diversity of talent and ideas within the industry but also hinders the industry's overall growth, innovation, and potential for positive social impact. Existing studies on gender gaps in technology fields, while valuable, often provide a limited understanding of the specific dynamics and challenges within the blockchain industry. There is a need for focused research that examines the gender gap in blockchain systems and investigates the unique factors that contribute to women's underrepresentation. This study aims to fill this gap by investigating the gender gap in blockchain systems, focusing on African American women's perspectives and their involvement in blockchain technology. By addressing this research gap, we can gain insights into the barriers African American women face in the industry and identify strategies to foster a more inclusive and equitable blockchain ecosystem.

The general research question is: What are the potential factors that lead to the gender gap in blockchain systems among African American women in the US who are influencers in the blockchain space? The sub-research questions are: How does race influence gender inequality in blockchain technology change among African American women in the US? How do trust and transparency influence the leadership position of African American women in the blockchain system? What are the key strategies or success factors to promote future gendered leadership in blockchain systems?

[The Cryptocurrency Bitcoin And Causal Effects Of Market Volatility](#) Gabriele Pauliuk, 2020-05-12. Academic Paper from the year 2018 in the subject Economics: Monetary theory and policy, grade 9-10. International School of Management Campus Munich course: Financial Geography, language: English. abstract: This work is about bitcoin and illegal trading as well as fluctuations and the causal effect of it. The recent emergence of new technologies in the financial sector and virtual communities lead to new types of transactions and started questioning the relevance of financial centers around the world. The main reason for the emergence of virtual currencies, cryptocurrencies, is not necessarily incapability or shortcomings of traditional currencies but rather the development of the internet and its networks. Unfortunately, cryptocurrencies raise more controversies on questions such as legal framework, financial risks, or effect on the economy. This is a challenge for the financial sector and the existence of financial centers. In the beginning, it is necessary to define Virtual Currencies. This type of currency can be defined as International Monetary Fund (IMF) in a research: Monetary and Capital Markets, Legal and Strategy and Policy Review. Departments describes digital representations of value issued by private developers and denominated in their own unit of account. This definition clarifies the usage of virtual currencies as it has the functionality to be transacted electronically, stored, accessed if two parties of a transaction confirm an exchange. Virtual currencies emerged because of the creation of a blockchain or so-called distributed ledger system. This system is exceptional because of decentralization principles. The most important detail in a system is the unique ledger of transactions. Bitcoin technology allows to have a consensus between

members of a network and decentralize transactions within a network      Why the Law Needs to Encompass Token Anjuli v. Hülst,2024-03-04 Academic Paper from the year 2021 in the subject Law Miscellaneous grade 1 0 University of Bologna language English abstract This paper examines the question of whether and why distributed ledger token should be legally encompassed To ensure a fundamental understanding it first describes the basic features of the distributed ledger technology and the main characteristics of token This is followed by a look at the function of law in general as well as with regard to property and technology in particular From these considerations the necessity of recognizing token as legal goods is derived coming to the concluding section where it will be addressed whether property law can be used to encompass token Though not evaluating any specific application of norms the paper argues for a corresponding openness in legal interpretation especially when it comes to disruptive technologies      Blockchain: A Practical Guide to Developing Business, Law, and Technology Solutions Joseph J. Direct and Indirect Participation and Feasibility** Philipp Rothe,2023-05-24 Master s Thesis from the year 2023 in the subject Business economics Investment and Finance grade 1 0 International School Of Management Campus Frankfurt language English abstract The aim of the master thesis is to examine whether private equity is suitable for tokenization After analyzing different characteristics of private equity such as the illiquidity or mechanisms like capital calls the master thesis concluded that the asset class is suitable Private equity shares in the form of security tokens can help to reduce illiquidity and cashflows like the capital calls can be automated by the use of smart contracts For the tokenization the master thesis recommends to use existing standards such as the Ethereum blockchain or the ERC 1400

token Furthermore different structures for issuing private equity tokens were elaborated These include a structure for an indirect participation via a special purpose vehicle which issues tokens and simultaneously invests into a fund but also a direct participation where the fund itself can issue tokens During the description of possible structures all relevant laws were included These include the German Electronic Securities Act eWpG German Banking Act KWG Security Prospectus Act WpPG Capital Investment Act VermAnlG Securities Trading Act WpHG and the German Investment Code KAGB All structures were evaluated from the perspective of private equity funds institutional investors private investors or other relevant intermediaries Also benefits and challenges for the different structures and participants were discussed The benefits include an increase in efficiency of several processes potential cost savings the possibility for funds to reach more investors or the possibility for investors to diversify their portfolio more Still these benefits could only be made use of if major challenges are mastered by the market participants These include an insufficient legal framework different hurdles when implementing a secondary market or the problem that theoretical approaches might work differently in reality

provided by national election authority and cast their vote by signing it with their private key and trusted miners could verify whether the votes are legit or not by using voter s public keys that makes the entire e voting process transparent cost effective safe and secure The proposed system consists of a GUI an application interface central database Blockchain network Pre election registration process voting counting final election results and auditing were explained The consensus algorithm was proof of work all the election properties such as validity privacy individuality flexibility etc were satisfied
