

GEOMETRY - Part 1

segments, lines, planes, geometric formulas

GEOMETRY HISTORY

Geometry means earth measurement. Early people used their basic knowledge of geometry to build roads, bridges, pyramids, and irrigation systems. The more formal study of geometry today is based on an interest in logical reasoning and mathematics, rather than in measurement alone. Euclid (c.300 B.C.), a legendary Greek geometer, was a brilliant volunteer set of books named **The Elements**, in which the geometric relationships were derived through deductive reasoning. Thus, the formal geometry studied today is often called **Euclidean geometry**. This geometry is also called **plane geometry** because the relationships deal with flat surfaces. Geometry has useful real terms, defined terms, postulates (statements that have not been proved, but have "worked" for thousands of years), and theorems (relationships that have been mathematically and logically proven).

GEOMETRIC FORMULAS

Perimeter: The perimeter, P , of a two-dimensional shape is the sum of all side lengths. Area: The area, A , of a two-dimensional shape is the number of square units that can be put in the shape enclosed by the sides. **Area:** Area is obtained through some combination of multiplying lengths and bases, adding halves, times 20° angles will work, except in circles. **Volume:** The volume, V , of a three-dimensional object is the number of cubic units that can be put in the object enclosed by all the sides.

Square Area:
 An $n \times n$ square has n^2 square units.
 An $n \times n$ square has n^2 square units.

Rectangle Area:
 An $n \times m$ rectangle has $n \times m$ square units.

Parallelogram Area:
 An $n \times m$ parallelogram has $n \times m$ square units.
 An $n \times m$ parallelogram has $n \times m$ square units.

Trapezoid Area:
 An $n_1 \times n_2 \times h$ trapezoid has $\frac{1}{2} (n_1 + n_2) \times h$ square units.
 An $n_1 \times n_2 \times h$ trapezoid has $\frac{1}{2} (n_1 + n_2) \times h$ square units.

Circle Area:
 An r circle has πr^2 square units.
 An r circle has πr^2 square units.
 An r circle has πr^2 square units.

Pythagorean Theorem:
 If a right triangle has legs a and b , and hypotenuse c , then $a^2 + b^2 = c^2$.

 An $r \times h$ cylinder has $\pi r^2 \times h$ cubic units.

Cone Volume:
 An $r \times h$ cone has $\frac{1}{3} \pi r^2 \times h$ cubic units.
 An $r \times h$ cone has $\frac{1}{3} \pi r^2 \times h$ cubic units.

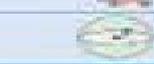

Triangular Prism Volume:
 An $n \times m \times h$ triangular prism has $\frac{1}{2} n \times m \times h$ cubic units.
 An $n \times m \times h$ triangular prism has $\frac{1}{2} n \times m \times h$ cubic units.

Rectangular Pyramid Volume:
 An $n \times m \times h$ rectangular pyramid has $\frac{1}{3} n \times m \times h$ cubic units.
 An $n \times m \times h$ rectangular pyramid has $\frac{1}{3} n \times m \times h$ cubic units.

 An r sphere has $\frac{4}{3} \pi r^3$ cubic units.

DESCRIPTIONS OF UNDEFINED TERMS

Point

- A point may be described as a location with no length, no width, and no depth.
- A point is a letter named with a capital letter. It is usually located by writing a dot above the name of a point, although the points cannot really be drawn because they have no dimensions. (See Examples 1, 2, and 3 on page 4.)

Line

- A line may be described as a set of points going straight on forever in two opposite directions. Lines are straight and uncurved. There is no end to a line. The phrase "straight line" is not necessary because straight is not straight if it curves. Lines are straight, but not with any depth. Lines cannot be lying down because they have width and depth. Exaggerations of lines are drawn in all planes as well as in diagrams that have two ends.
- Lines are usually named by one or two letters. The line containing points K and N may be named by either:
 - Using only the 1-letter name, then these points on the line with a line indicator above the points. For example, \overleftrightarrow{KN} or \overleftrightarrow{NK} (the order of the letters doesn't matter); the line indicator above the capital letters always points horizontally from left to right and never in any other direction. It is the usual direction of the points in space that determines the location and direction of the real line, not the direction of the line indicator above the capital letters on the diagram.
 - By using the letters with capital letters with a number subscript. For example, ℓ_1 or ℓ_2 .

C: There is no geometry in which points are the largest, smallest, or most numerous. No geometry is there.

Planes

- A plane may be described as a set of points going on forever in all directions except for a little hole that causes depth. Imagine the very surface of a perfectly flat piece of paper extending on forever in every direction but having no thickness at all. This could be a flat structure such that when any two points in this plane are connected by a line, all points on the line are also in the plane. Planes have length and width, but no depth.
- Planes are usually referred to as "plane ℓ " or "plane ABC ," "any 3 points on the plane that are not on the same line" or "the plane containing \dots whatever points in the diagram." Planes cannot be drawn. Representations of planes are usually drawn as parallelograms, either with the arrows indicating that the planes go on forever or without the arrows even though the points do go on forever.

Postulates

Postulates are statements that have been used and accepted for centuries without formal proof. These are postulates:

- A line contains at least 2 points, and any 2 points locate exactly one line.

- A plane contains at least 3 points that are not all on the same line, and any 3 points that are not on the same line locate exactly one plane. Therefore, a line and one point not on the line also locate exactly one plane.

C: Any 3 points locate at least one plane.

- Two points of a line are in a plane, then the line is in the plane, or: If two points are in a plane then the line containing the two points is also in the plane.

- Two planes intersect, then their intersection is a line.

DEFINED TERMS

There are many defined terms of plane geometry. The definitions of these terms will be given by name, group, throughout the study guide rather than grouped by one big list.

Point: Postulates for geometry are relationships and statements that have worked for centuries and are accepted as true. Relationships and statements that have been proved mathematically. Postulates and theorems are proved through logic. They also are stated under the various levels of geometry. Sometimes they are called axioms, postulates, or theorems, and sometimes they are simply named and not labeled.

Space

Space is the set of all points. Space goes on forever in every direction, with infinite length, width, and depth. Space has no special location. It is simply defined as space. Space contains at least 4 points that are not all on the same plane.

General Terms

- Two adjacent shapes on the same edge of a polygon are adjacent. After some movement of the shapes they can be made to fit exactly on top of each other.
- Two corresponding parts of adjacent polygons are adjacent. That is, one of the polygons has two sides shared and the other has two sides shared. The parts that match correspondingly are adjacent.
