Bayesian approach to SEMs including the selection of prior distributions and data augmentation and offers an overview of the subject's recent advances. Demonstrates how to utilize powerful statistical computing tools including the Gibbs sampler, the Metropolis-Hastings algorithm, bridge sampling, and path sampling to obtain the Bayesian results. Discusses the Bayes factor and Deviance Information Criterion (DIC) for model comparison. Includes coverage of complex models including SEMs with ordered categorical variables and dichotomous variables, nonlinear SEMs, two-level SEMs, multisample SEMs, mixtures of SEMs, SEMs with missing data, SEMs with variables from an exponential family of distributions, and some of their combinations. Illustrates the methodology through simulation studies and examples with real data from business management, education, psychology, public health, and sociology. Demonstrates the application of the freely available software WinBUGS via a supplementary website featuring computer code and data sets.

Structural Equation Modeling: A Bayesian Approach is a multi-disciplinary text ideal for researchers and students in many areas including statistics, biostatistics, business, education, medicine, psychology, public health, and social science.

Principles and Practice of Structural Equation Modeling by Rex B. Kline, 2005. This book is intended to serve as a guide to the principles, assumptions, strengths, limitations, and applications of structural equation modeling (SEM) for researchers and students who do not have extensive quantitative backgrounds. Some familiarity with basic concepts such as correlation is assumed, but higher levels of statistical knowledge are not required. Accordingly, the presentation is conceptually rather than mathematically oriented; the use of formulas and symbols is kept to a minimum, and many examples are offered of the application of SEM to a wide variety of research problems in psychology, education, and health sciences among other areas. This book also has a home page on the Internet: www.guilford.com/Kline.

Structural Equation Modeling by Natasha K. Bowen and Shenyang Guo, 2011-09-23. Structural Equation Modeling (SEM) has long been used in social work research, but the writing on the topic is typically fragmented and highly technical. This pocket guide fills a major gap in the literature by providing social work researchers and doctoral students with an accessible synthesis. The authors demonstrate two SEM programs with distinct user interfaces and capabilities: Amos and Mplus, with enough specificity that readers can conduct their own analyses without consulting additional resources. Examples from social work literature highlight best practices for the specification, estimation, interpretation, and modification of structural equation models. Unlike most sources on SEM, this book provides clear guidelines on how to evaluate SEM output and how to proceed when model fit is not acceptable. Oftentimes, confirmatory factor analysis and general structure modeling are the most flexible, powerful, and appropriate choices for social work data. Richly illustrated with figures, equations, matrices, and tables, this pocket guide empowers social workers with a set of defensible analysis strategies that allows for competent, confident use of SEM.
