

# Types of Transformations

## Big Picture

Transformations move and modify geometric shapes. There are several types of transformations that all transform figures in different ways. These transformations can be rigid (isometric) or non-rigid.

## Key Terms

**Transformation:** An operation that moves, flips, or changes a figure to create a new figure.

**Rigid:** A transformation that preserves size and shape.

**Isometry:** Another word for rigid transformation, a transformation that does not change the shape or size of a figure.

**Non-Rigid:** A transformation that does not preserve size

**Prefimage:** The original figure before a transformation.

**Image:** The figure after a transformation.

**Vector:** A quantity that has direction and size

## Rigid Transformations

Specifically, **rigid transformations** (or congruence transformations) transform a figure without changing its size or shape.

The three types of rigid transformations are:

- **Reflection:** A transformation that turns a figure into its mirror image by flipping it over a line.
- **Rotation:** A transformation that turns a figure around a fixed point to create an image.
- **Translation:** A transformation that moves every point in a figure the same distance in the same direction.

To distinguish between the **prefimage** and the **image**, primes are used to label the image. The arrow  $\rightarrow$  is used to describe a transformation.

- **Example:** If the **prefimage** is  $A$ , then the **image** would be  $A'$ .  $A \rightarrow A'$

## Reflections

Another way to describe a reflection is a "flip."

- **Image** is the same distance away from the reflection line as the **prefimage**.

### Reflections over the x-axis

Coordinates stay the same with a coordinate change.

- If  $(x, y)$  is reflected over the  $x$ -axis, then the image is  $(x, -y)$ .
- If  $(x, y)$  is reflected over  $y = -x$ , then the image is  $(-y, -x)$ .

### Reflections over the y-axis

Coordinates change with a coordinate stay constant.

- If  $(x, y)$  is reflected over the  $y$ -axis, then the image is  $(-x, y)$ .
- If  $(x, y)$  is reflected over  $y = -x$ , then the image is  $(y, -x)$ .

### Reflections over the origin

Coordinates change with a coordinate change, but the total  $x + y$  and  $y - x$  are equal to zero.

- If  $(x, y)$  is reflected over the origin, then the image is  $(-x, -y)$ .
- If  $(x, y)$  is reflected over  $y = -x$ , then the image is  $(y, -x)$ .
