## **Transformation Methods For Partial Differential Equations:**

**Transform Methods for Solving Partial Differential Equations** Dean G. Duffy, 1994-02-16 For most scientists and engineers the only analytic technique for solving linear partial differential equations is separation of variables In *Transform Methods for Solving Partial Differential Equations* the author uses the power of complex variables to demonstrate how Laplace and Fourier transforms can be harnessed to solve many practical everyday problems experienced by scientists and engineers Unlike many mathematics texts this book provides a step by step analysis of problems taken from scientific and engineering literature Detailed solutions are given in the back of the book This essential text reference draws from the latest literature on transform methods to provide in depth discussions on the joint transform problem the Cagniard de Hoop method and the Wiener Hopf technique Some 1 500 references are included as well *Transformation Methods for Nonlinear Partial Differential Equations* Dominic G. B. Edelen, Jian-hua Wang, 1992 The purpose of the book is to provide research workers in applied mathematics physics and engineering with practical geometric methods for solving systems of nonlinear partial differential equations The first two chapters provide an introduction to the more or less classical results of Lie dealing with symmetries and similarity solutions The results however are presented in the context of contact manifolds rather than the usual jet bundle formulation and provide a number of new conclusions The remaining three chapters present essentially new methods of solution that are based on recent publications of the authors The text contains numerous fully worked examples so that the reader can fully appreciate the power and scope of the new methods In effect the problem of solving systems of nonlinear partial differential equations is reduced to the problem of solving families of autonomous ordinary differential equations This allows the graphs of solutions of the system of partial differential equations to be realized as certain leaves of a foliation of an appropriately defined contact manifold In fact it is often possible to obtain families of solutions whose graphs foliate an open subset of the contact manifold These ideas are extended in the final chapter by developing the theory of transformations that map a foliation of a contact manifold onto a foliation This analysis gives rise to results of surprising depth and practical significance In particular an extended Hamilton Jacobi method for solving systems of partial differential equations is obtained

**Transformation Methods For Nonlinear Partial Differential Equations** Dominic G B Edelen, Jian-hua Wang, 1992-06-09 The purpose of the book is to provide research workers in applied mathematics physics and engineering with practical geometric methods for solving systems of nonlinear partial differential equations The first two chapters provide an introduction to the more or less classical results of Lie dealing with symmetries and similarity solutions The results however are presented in the context of contact manifolds rather than the usual jet bundle formulation and provide a number of new conclusions The remaining three chapters present essentially new methods of solution that are based on recent publications of the authors The text contains numerous fully worked examples so that the reader can fully appreciate the power and scope of the new methods In effect the problem of solving systems of nonlinear

partial differential equations is reduced to the problem of solving families of autonomous ordinary differential equations. This allows the graphs of solutions of the system of partial differential equations to be realized as certain leaves of a foliation of an appropriately defined contact manifold. In fact it is often possible to obtain families of solutions whose graphs foliate an open subset of the contact manifold. These ideas are extended in the final chapter by developing the theory of transformations that map a foliation of a contact manifold onto a foliation. This analysis gives rise to results of surprising depth and practical significance. In particular an extended Hamilton Jacobi method for solving systems of partial differential equations is obtained.

*Partial Differential Equations* George F. Carrier, Carl E. Pearson, 1976      *Transformation methods in the study of nonlinear partial differential equations* Christodoulos Sophocleous, 1991      **Select Ideas in Partial Differential Equations** Peter J Costa, 2021-06-15 This text provides an introduction to the applications and implementations of partial differential equations. The content is structured in three progressive levels which are suited for upper level undergraduates with background in multivariable calculus and elementary linear algebra chapters 1-5 first and second year graduate students who have taken advanced calculus and real analysis chapters 6-7 as well as doctoral level students with an understanding of linear and nonlinear functional analysis chapters 7-8 respectively. Level one gives readers a full exposure to the fundamental linear partial differential equations of physics. It details methods to understand and solve these equations leading ultimately to solutions of Maxwell's equations. Level two addresses nonlinearity and provides examples of separation of variables, linearizing change of variables and the inverse scattering transform for select nonlinear partial differential equations. Level three presents rich sources of advanced techniques and strategies for the study of nonlinear partial differential equations including unique and previously unpublished results. Ultimately the text aims to familiarize readers in applied mathematics, physics and engineering with some of the myriad techniques that have been developed to model and solve linear and nonlinear partial differential equations.      [Solving Nonlinear Partial Differential Equations with Maple and Mathematica](#) Inna Shingareva, Carlos Lizárraga-Celaya, 2011-07-24 The emphasis of the book is given in how to construct different types of solutions: exact, approximate, analytical, numerical, graphical of numerous nonlinear PDEs correctly, easily and quickly. The reader can learn a wide variety of techniques and solve numerous nonlinear PDEs included and many other differential equations simplifying and transforming the equations and solutions, arbitrary functions and parameters presented in the book. Numerous comparisons and relationships between various types of solutions, different methods and approaches are provided. The results obtained in Maple and Mathematica facilitates a deeper understanding of the subject. Among a big number of CAS we choose the two systems Maple and Mathematica that are used worldwide by students, research mathematicians, scientists and engineers. As in our previous books we propose the idea to use in parallel both systems Maple and Mathematica since in many research problems frequently it is required to compare independent results obtained by using different computer algebra systems Maple and or Mathematica at all stages of the solution process. One of the main

points related to CAS is based on the implementation of a whole solution method e.g. starting from an analytical derivation of exact governing equations constructing discretizations and analytical formulas of a numerical method performing numerical procedure obtaining various visualizations and comparing the numerical solution obtained with other types of solutions considered in the book e.g. with asymptotic solution
