(a) Business Cycle

The business cycle is a series of fluctuations in real GDP. The cycle is divided into four phases: expansion, peak, contraction, and trough. The expansion phase is characterized by a steady increase in real GDP. The peak is the highest point of the cycle. The contraction phase is characterized by a steady decrease in real GDP. The trough is the lowest point of the cycle.

The real business cycle model is a theoretical model that explains the business cycle. It is based on the idea that the business cycle is caused by changes in the real return to capital. When the real return to capital is high, investment is high, and the economy grows. When the real return to capital is low, investment is low, and the economy contracts.

The real business cycle model is a dynamic model. It shows how the economy evolves over time. The model is based on the following assumptions:
