explore different combinations of hyperparameters and select the configuration that yielded the highest accuracy on the training data These hyperparameters included settings like the number of estimators learning rate and kernel function depending on the specific model After obtaining the best hyperparameters for each model we trained them on our preprocessed dataset This training process involved using the training data to teach the model to make predictions on new unseen examples Once trained the models were ready for evaluation We assessed the performance of each model using a set of well established evaluation metrics These metrics included accuracy precision recall and F1 score Accuracy measured the overall correctness of predictions while precision quantified the proportion of true positive predictions out of all positive predictions Recall on the other hand represented the proportion of true positive predictions out of all actual positives highlighting a model s ability to identify positive cases The F1 score combined precision and recall into a single metric helping us gauge the overall balance between these two aspects To visualize the model s performance we created key graphical representations These included confusion matrices which showed the number of true positive true negative false positive and false negative predictions aiding in understanding the model s classification results Additionally we generated Receiver Operating Characteristic ROC curves and area under the curve AUC scores which depicted a model s ability to distinguish between classes High AUC values indicated excellent model performance Furthermore we constructed true values versus predicted values diagrams to provide insights into how well our models aligned with the actual data distribution Learning curves were also generated to observe a model s performance as a function of training data size helping us assess whether the model was overfitting or underfitting Lastly we presented the results in a clear and organized manner saving them to Excel files for easy reference This allowed us to compare the performance of different models and make an informed choice about which one to select for our specific task In summary this project was a comprehensive exploration of the machine learning model development and evaluation process We prepared the data selected and fine tuned various models assessed their performance using multiple metrics and visualizations and ultimately arrived at a well informed decision about the most suitable model for our dataset This approach serves as a valuable blueprint for tackling real world machine learning challenges effectively   Python AI Programming Patrick J,2024-01-03 This book aspires young graduates and programmers to become AI engineers and enter the world of artificial intelligence by combining powerful Python programming with artificial intelligence Beginning with the fundamentals of Python programming the book gradually progresses to machine learning where readers learn to implement Python in developing predictive models The book provides a clear and accessible explanation of machine learning incorporating practical examples and exercises that strengthen understanding We go deep into deep learning another vital component of AI Readers gain a thorough understanding of how Python s frameworks and libraries can be used to create sophisticated neural networks and algorithms which are required for tasks such as image and speech recognition Natural Language Processing is also covered in the book with fundamental
