## Introduction

Design variables provide a method for specifying critical parameters just before a simulation. This allows you to make quick changes to parameter values across single or multiple circuit components without having to edit any schematic components. Design variables can also be used in simple parametric analysis, which can change a design variable across a range of values and display multiple simulation results on a single plot.

## Using Design Variables

This part of the tutorial will show you how to parametrize the width of the PCB01 and PCB02 members of an circuit by using design variables. These variable values are then set using the **Running Through Environment** panel in simulation.

1. Make a copy of the circuit with components you have previously designed, or create a new one.
2. Open the schematics of the circuit.
3. Right click on the PCB01 component to edit it, and open the properties by either clicking on it and selecting **Properties**, or you can press "q" as a shortcut.
4. Define the **width** in the **width** box, and type  $var$ . This specifies that a variable called  $var$  will be used to set the width of the PCB01. When you do this, observe that values for "Characteristic Impedance (Z0)" change from a constant value to a formula that involves the variable  $var$ . Always check to make sure that formula is updated when you change the width to a variable otherwise, your simulation results will be incorrect. Click **OK** to apply the change.
5. Repeat this procedure to change the width of the PCB02 to  $var$ .
6. Select **Check**  $\rightarrow$  **Check and Save**. Verify that there are no errors.
7. Launch the **Analysis** **Running Through Environment**.
8. Set up the simulation environment as you normally would for simulating a schematic. This includes specifying a simulation file and transient run length, making the SPICE model reader in the environment options, and selecting the outputs to be plotted on the waveform.
9. In **ADV**, select **Variables**  $\rightarrow$  **Copy Waveform**. The design variables  $var$  and  $var$  should appear in the Design Variables area of the **Running Environment** Window.
10. In **ADV**, select **Variables**  $\rightarrow$  **Set**. In the **Set** box, type  $var$  and then apply the value by clicking **Apply**. Change the value of  $var$  to 0.01 and click **Apply**. Check the values have been assigned, click **OK**. See Figure 1 and 2 below.
11. In **ADV**, use the connections by selecting **Simulation**  $\rightarrow$  **Variable and Run**. After loading the file instructions to complete, the variable waveform will graph. The results should be
