Introduction to Visual Computing Aditi Majumder, M. Gopi, 2018-01-31 Introduction to Visual Computing Core Concepts in Computer Vision Graphics and Image Processing covers the fundamental concepts of visual computing Whereas past books have treated these concepts within the context of specific fields such as computer graphics computer vision or image processing this book offers a unified view of these core concepts thereby providing a unified treatment of computational and mathematical methods for creating capturing analyzing and manipulating visual data e.g. 2D images 3D models Fundamentals covered in the book include convolution Fourier transform filters geometric transformations epipolar geometry 3D reconstruction color and the image synthesis pipeline The book is organized in four parts The first part provides an exposure to different kinds of visual data e.g. 2D images videos and 3D geometry and the core mathematical techniques that are required for their processing e.g. interpolation and linear regression The second part of the book on Image Based Visual Computing deals with several fundamental techniques to process 2D images e.g. convolution spectral analysis and feature detection and corresponds to the low level retinal image processing that happens in the eye in the human visual system

pathway The next part of the book on Geometric Visual Computing deals with the fundamental techniques used to combine the geometric information from multiple eyes creating a 3D interpretation of the object and world around us e.g. transformations projective and epipolar geometry and 3D reconstruction This corresponds to the higher level processing that happens in the brain combining information from both the eyes thereby helping us to navigate through the 3D world around us The last two parts of the book cover Radiometric Visual Computing and Visual Content Synthesis These parts focus on the fundamental techniques for processing information arising from the interaction of light with objects around us as well as the fundamentals of creating virtual computer generated worlds that mimic all the processing presented in the prior sections The book is written for a 16 week long semester course and can be used for both undergraduate and graduate teaching as well as a reference for professionals

Introduction to Computer Graphics Hans-Joachim Bungartz, Michael Griebel, Christoph Zenger, 2004 In this essential guide to programming computer graphics the authors begin with the basics of generating images from scratch on a computer screen taking the first chapter to discuss coordinate systems and transformations rudimentary shapes and the representation of grays and colors The book then moves into ways to model and then represent a three dimensional figure covering mathematical models the vef graph Euler operators B zier curves and then three dimensional clipping lighting effects shading visualization and ray tracing The final chapter addresses specific applications of techniques such as mapping stereography and image processing explaining their use in representing natural objects as well as in virtual reality programming This book can be used as a reference for professionals in the computer graphics field and a textbook for students of computer graphics programming

Image Processing for Computer Graphics and Vision Luiz Velho, Alejandro C. Frery, Jonas Gomes, 2009-08-29 Image processing is concerned with the analysis and manipulation of images by computer Providing a thorough treatment of image processing with an emphasis on those aspects most used in computer graphics the authors concentrate on describing and analyzing the underlying concepts rather than on presenting algorithms or pseudocode As befits a modern introduction to this topic a good balance is struck between discussing the underlying mathematics and the main topics signal processing data discretization the theory of colour and different colour systems operations in images dithering and half toning warping and morphing and image processing This second edition reflects recent trends in science and technology that exploit image processing in computer graphics and vision applications Stochastic image models and statistical methods for image processing are covered as are A modern approach and new developments in the area Probability theory for image processing Applications in image analysis and computer vision
