Formation flight is the primary movement technique for teams of helicopters. However, the potential for accidents is greatly increased when helicopter teams are required to fly in tight formations and under harsh conditions. The starting point for safe autonomous flight formations is to design a distributed control law attenuating external disturbances coming into a formation, so that each vehicle can safely maintain sufficient space between it and all other vehicles. In order to avoid the conservative nature inherent in distributed MPC algorithms, we begin by designing a stable MPC for individual vehicles, and then introducing carefully designed inter-agent coupling terms in each performance index. The proposed algorithm works in a decentralized manner, and is applied to the problem of helicopter formations comprised of heterogeneous vehicles. The disturbance attenuation property of the proposed MPC controller is validated throughout a series of computer simulations.

I. Introduction

ROTORCRAFT have revolutionized the offensive, defensive, reconnaissance, and security operations in the battlefield due to their mobility, range, and versatility (including vertical take-off and landing (VTOL) capability). With recent advances in technology, such as aerial refueling and night vision, helicopters have taken on increasingly important roles in military operations. Formation flight is the primary movement technique for helicopter teams.¹ By maintaining a coordinated formation, it is possible to achieve flight integrity with less fuel consumption than an unstructured flight, increasing the possibility of a mission's success.

Even with such unique flight capabilities, helicopter teams are confronted by very challenging situations. The potential for accidents is increased by requirements to fly in close formation and under harsh conditions including poor weather and extremely low altitudes. The effects of battlefield stress exerted on an aircrew increase dramatically under these adverse circumstances. We propose that computer-assisted autonomous formation flight procedures can be implemented to help to diminish battlefield stress.

Even though helicopter formation flight is of critical importance in various operations, little research has been done on this topic. Since helicopter dynamics are notoriously complex and uncertain, until recently it had not been feasible to design an automatic controller for a single helicopter. However, recent advances in system identification techniques and control of rotorcraft-based unmanned aerial vehicles (RUAVs)^{2,3} have provided insight into autonomous helicopter formation flight. Although several researchers have made efforts on the stable helicopter formation,⁴⁻⁵ their applications have been restricted to homogeneous formations in which all the vehicles have identical dynamics.

Model Predictive Control (MPC), also known as moving horizon or Receding Horizon Control (RHC), has been a useful technique for the control of slow dynamic systems such as chemical processes because the scheme requires high computational speed of the control hardware due to its on-line nature. Recently, the rapid development of digital processors, and powerful and inexpensive controllers make it possible to adopt MPC into hard real-time applications.⁶

MPC can provide a better performance in controlling uncertain plants since it can update the gain of the controller based on the current states, whereas fixed-gain control algorithms cannot.⁷ The capability to

Autonomous Flying Robots Kenzo Nonami, Farid Kendoul, Satoshi Suzuki, Wei Wang, Daisuke Nakazawa, 2010-09-15 The advance in robotics has boosted the application of autonomous vehicles to perform tedious and risky tasks or to be cost effective substitutes for their man counterparts Based on their working environment a rough classification of the autonomous vehicles would include unmanned aerial vehicles UAVs manned ground vehicles UGVs autonomous underwater vehicles AUVs and autonomous surface vehicles ASVs UAVs UGVs AUVs and ASVs are called UVs unmanned vehicles nowadays In recent decades the development of manned autonomous vehicles have been of great interest and different kinds of autonomous vehicles have been studied and developed all over the world In particular UAVs have many applications in emergency situations humans often cannot come close to a dangerous natural disaster such as an earthquake a good an active volcano or a nuclear disaster Since the development of the first UAVs research efforts have been focused on military applications Recently however demand has arisen for UAVs such as aerial robots and flying robots that can be used in emergency situations and in industrial applications Among the wide variety of UAVs that have been developed small scale HUAVs helicopter based UAVs have the ability to take off and land vertically as well as the ability to cruise in flight but their most important capability is hovering Hovering at a point enables us to make more effective observations of a target Furthermore small scale HUAVs offer the advantages of low cost and easy operation

Autonomous Formation Flight of Helicopters Hoam Chung, 2006 When a vehicle outside of the formation approaches a vehicle at the edge of the formation the motion of the vehicle at the formation edge acts like a disturbance with respect to the vehicle attempting to join the formation The vehicle at the edge of the formation cannot cooperate with any vehicle outside of the formation due to constraints on maintaining the existing formation

Discrete Networked Dynamic Systems Magdi S. Mahmoud, Yuanqing Xia, 2020-10-22

Discrete Networked Dynamic Systems Analysis and Performance provides a high level treatment of a general class of linear discrete time dynamic systems interconnected over an information network exchanging relative state measurements or output measurements It presents a systematic analysis of the material and provides an account to the math development in a unified way The topics in this book are structured along four dimensions Agent Environment Interaction and Organization while keeping global system centered and local agent centered viewpoints The focus is on the wide sense consensus problem in discrete networked dynamic systems The authors rely heavily on algebraic graph theory and topology to derive their results It is known that graphs play an important role in the analysis of interactions between multiagent distributed systems Graph theoretic analysis provides insight into how topological interactions play a role in achieving coordination among agents Numerous types of graphs exist in the literature depending on the edge set of G A simple graph has no self loop or edges Complete graphs are simple graphs with an edge connecting any pair of vertices The vertex set in a bipartite graph can be partitioned into disjoint non empty vertex sets whereby there is an edge connecting

every vertex in one set to every vertex in the other set Random graphs have fixed vertex sets but the edge set exhibits stochastic behavior modeled by probability functions Much of the studies in coordination control are based on deterministic fixed graphs switching graphs and random graphs This book addresses advanced analytical tools for characterization control estimation and design of networked dynamic systems over fixed probabilistic and time varying graphs Provides coherent results on adopting a set theoretic framework for critically examining problems of the analysis performance and design of discrete distributed systems over graphs Deals with both homogeneous and heterogeneous systems to guarantee the generality of design results
