Three Theories of the Solar System

Three Theories of the Solar System

Three theories (geocentric, heliocentric, and tidal) try to describe how the solar system formed.

In the geocentric theory, the Earth is at the center of the solar system. The sun, planets, and moons orbit around it. This theory was developed by ancient Greek philosopher Aristotle and was the dominant theory for centuries.

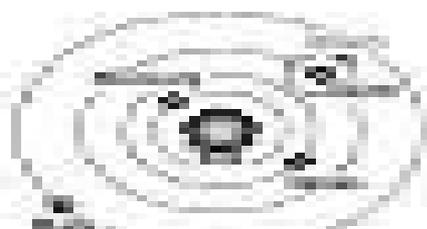

During the Renaissance, Copernicus proposed a heliocentric theory where the sun is at the center of the solar system. This theory was supported by Galileo's observations of the moons of Jupiter and the phases of Venus. The geocentric theory was eventually replaced by the heliocentric theory, which is the current accepted model of the solar system.

During the 18th century, Laplace proposed a nebular theory of the solar system. He suggested that the solar system formed from a rotating cloud of gas and dust. As the cloud collapsed, it flattened into a disk, and the sun formed at the center. The planets formed from the material in the disk.

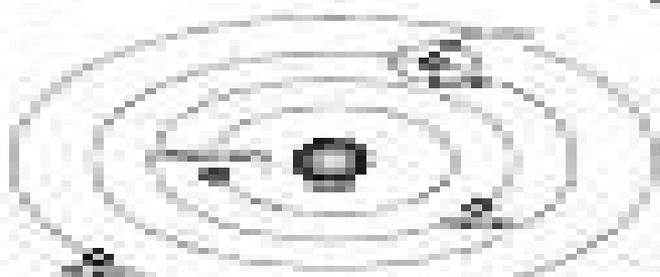

Laplace's theory was supported by observations of other star-forming regions. It is the current accepted model of the solar system. The geocentric theory was replaced by the heliocentric theory, which is the current accepted model of the solar system.
