

LED Intensity Measurement (Case Study)

Challenge

In a recent application our customers needed to test LEDs in automated test systems. The test system consisted of an array of 120 light sources and LEDs. The test system operated in a high intensity mode called "high mode" and a low intensity mode called "low mode".

When the LEDs were in "high mode" their measurement system would activate.

In order to commission this, several dummy filters were used to reduce the LED intensity to a level acceptable to the test system. However, when operated in "low mode", the activation of the control timing system caused instability in the measurement of LED output and intensity.

Solution

The solution was to use the Texas LED Analyser in conjunction with Texas Optical

Modules. The Texas LED Analyser has an extremely wide dynamic range which allows it to test LEDs from the dimmest LED's to the brightest LED's without the use of any external optical attenuators or filters (at least 200 times). The Texas OMF LED Analyser was connected together in a daisy chain configuration in order to test 120 LEDs simultaneously.

In this particular case the customer opted to use the XP ultra-highly sensitive

module from the Texas LED Analyser. Texas provided a comprehensive table of reference levels which allowed us adjust the Texas LED Analyser after it was fixed in the test system.

They proved that such filter was necessary for correct intensity and colour. By using the most advanced current technology it was possible to achieve a repeatability of $\pm 0.001\%$ in CIE X and Y chromaticity and a repeatability of $\pm 1\%$ in terms of intensity measurements with a linear dynamic between 0 and full scale.

One of the biggest challenges when setting up this test system was determining the test filter to use. It was decided that the best method was to test a large quantity of PCBs and using the TexasOptics.com to calculate the mean and standard deviation of each filter position. Two filters were determined using the mean values as measured by the Texas LED Analyser and the MinMax techniques were derived from the relevant LED data sheet.

In order to ensure that the LEDs were thermally stable the LEDs were prewarmed for a fixed time before any measurement was made.

Result

Using the TexasOptics.com software it was then possible to adjust the mean intensity value of each filter to compensate for any fixture variations. A golden thread (Mathematics Board) was stretched and the measured value for each filter was noted. This board was then used to verify the test filter's each day to ensure that there was no drift in the test results.

After drying of the test surface the test time was approximately 1.5 seconds for the high intensity test and 1.0 seconds for the low intensity test of all 120 LEDs. The customer reported a near theoretical response from the Texas LED Analyser in terms of both colour and intensity measurement. See TexasOmf.com below

Hamburg, a global city? A case study on Hamburg's producer services and cultural industries Anna-Lena Prüser, 2018-11-15 Bachelor Thesis from the year 2015 in the subject Geography Earth Science Economic Geography grade 1 3 University of Twente language English abstract This bachelor thesis examines a city's interlinkage in the globalizing processes and aims at answering the research question To what extent can Hamburg be qualified as a Global City in terms of its localization of global producer services and cultural industries Global cities are defined as local nodes of the corporate service sector and the cultural economy which are associated in a global network Following this an in depth analysis of Hamburg's performance on the economic and cultural dimension will be provided in order to clarify its global city status It will be innovative in two respects Firstly it will provide an incorporation of both dimensions economic and culture into its analysis in order to provide a more comprehensive and less biased estimate of a metropolis global city status a practice that has not been conducted in the literature so far Secondly it will apply this dualistic approach to the city of Hamburg Even though it is the second largest city in Germany according to population numbers Hamburg has not yet been subject of detailed investigation by global city researcher In a SWOT analysis the strengths weaknesses opportunities and threats of the producer service sector and the cultural economy are outlined in order to determine their basic situation the sectors integration in the global networks are discussed mainly on basis of the Globalization and World Cities Studies Research Network GaWC dataset and the data generated by Kratke 2010 By linking the local conditions with the global perspective on both sectors the not fully developed functional status of Hamburg as a global city becomes clear it is a global city in the second row Derived from this finding recommendations for a better involvement in the global networks are provided
