

Chapter 10.10 From DNA to Protein Synthesis

Problems

What percentage of total cell protein is protein?

Background

Genetic proteins are the main structural components of living cells. In addition, they also are involved in metabolism and reproduction and other "life" functions. The specific sequence of amino acids in the protein is determined by the sequence of nucleotides in the DNA. The amino acids are joined together by peptide bonds to form a polypeptide chain. The polypeptide chain is then folded into a specific three-dimensional shape to form a protein.

Explain how you will determine the sequence of amino acids in a protein.

Methodology

Experimental Design

Open-Ended Questions

1. Describe the process of protein synthesis from DNA to protein.

The amino acid sequence is determined by the DNA sequence. The amino acids are joined together by peptide bonds to form a polypeptide chain. The polypeptide chain is then folded into a specific three-dimensional shape to form a protein.

2. Compare and contrast the two types of protein synthesis.

What are the differences in the two types of protein synthesis?

There are two types of protein synthesis: transcription and translation. Transcription is the process of copying a segment of DNA into RNA. Translation is the process of using the information in RNA to synthesize a protein.

3. Explain the role of the ribosome in protein synthesis.

The ribosome is a complex of RNA and protein that is responsible for translating the genetic code into a protein. It consists of two subunits, a large subunit and a small subunit. The large subunit is responsible for catalyzing the formation of peptide bonds, while the small subunit is responsible for decoding the mRNA.
