Fresh fruit vegetables and ornamentals are composed of living tissues that experience continuous change after harvest Some of these changes are desirable e g development of sugars and improved texture during fruit ripening while others are not e g discoloration and loss of nutrients in fresh cut vegetables Senescence is the final stage in the development of plant organs culminating in a series of irreversible events leading to cellular breakdown and death These postharvest changes cannot be stopped but they can be managed to maintain optimal quality longer Maintaining recommended temperature and relative humidity while minimizing wounding and microbial contamination constitute the foundation of effective postharvest handling The first chapter of this volume describes biological factors affecting these crops including respiration rates of ethylene production water loss physical damage and damage due to pathogens environmental factors such as temperature humidity ethylene and sunlight Subsequent chapters explore the use of biotechnology to improve postharvest results and postharvest handling operations for ornamentals and cut flowers for fresh herbs for fruit vegetables e g cucurbits tomatoes for leafy and stem vegetables and for underground vegetables roots tubers bulbs Handy easy to use tables and charts along with color photographs illustrate important points throughout A comprehensive table summarizes storage recommendations for produce a second table summarizes storage recommendations for cut flowers and greens This is Volume 7 in Postharvest Technology of Horticultural Crops 4th Edition

Drawing on the expertise of the University of California's Postharvest Technology Center this publication discusses commercial uses of modified or controlled atmosphere technology which can be used during transport temporary storage or long term storage of horticultural commodities destined for the fresh market or processing In modified atmospheres and controlled atmospheres gases are removed or added to create an atmospheric composition around a commodity that is different from that of air Modified or controlled atmosphere technology can be used during transport temporary storage or long term storage of horticultural commodities destined for the fresh market or processing Chapter 1 discusses how modified or controlled atmosphere technology can be used during transport temporary storage or long term storage of horticultural commodities destined for the fresh market or processing Chapter 2 discusses the ways biologically important gases are sampled analyzed and mixed Since the rate of respiration of plant tissue is tightly coupled to its overall metabolic rate and often inversely proportional to shelf life the measurement and control of respiration are of vital interest in devising strategies to maintain quality after harvest Chapter 3 discusses the role of Ethylene in the postharvest life of many horticultural crops Sometimes this role is beneficial promoting faster and more uniform ripening before retail distribution and sometimes it is deleterious speeding

senescence and reducing shelf life This chapter addresses the properties of this gas and ways to both harness its beneficial effects and avoid undesirable results during the postharvest handling of perishable commodities Post Harvest Technology of Horticultural Crops: Introduction to Post Harvest Technology; CH:2 Postharvest Losses; CH:3 Structure and Composition of Fruits and Vegetables; CH:4 Maturity and Harvesting of Fruits and Vegetables; CH:5 Packinghouse Unit Operations; CH:6 Storage of Fruits and Vegetables; CH:7 Processing of Fruits and Vegetables; CH:8 Dehydration of Fruits and Vegetables; CH:9 Fermentation and Fermented Product; CH:10 Food Packaging; CH:11 Transportation of Fruits and Vegetables; CH:12 Overview of Food Quality and Food Safety; Bibliography; Index Marley Gibbs Pablo Steele, 2018 **Postharvest Technology of Horticultural Crops** Adel A.
