growth of power requirements in spacecraft due to complex computational and instrumental needs it is essential that it is equipped with high performance power converters There also exists the challenge of mass and volume constraints for spacecraft hence the power converters must be designed with high power density to meet such demands To design power converters with high power density for space applications radiation hardened gallium nitride GaN semiconductor switches must be used To meet the high power requirements the photovoltaics PV powering the system must also function at its maximum power point MPP Although PV efficiency has increased over time solar irradiance and temperatures can fluctuate dramatically in deep space which causes substantial variations in the MPP of the PV array which can decrease the overall system efficiency Thus it is always imperative to track the MPP of the PV panels to maintain optimal efficiency This thesis establishes GaN as the most suitable device in DC DC converters for space applications and compares it with traditional semiconductor devices To tackle the problem of maximum power point tracking MPPT this thesis shows the development and simulation of a digital MPPT controller which employs the ripple correlation control RCC algorithm It is explained why RCC supersedes the conventional perturb and observe P the development and simulation of an analog controller is also shown This digital RCC based MPPT controller logic can be ported to any microcontroller to be used as an MPPT controller for DC DC converters with any topology The results show the efficacy of the developed MPPT controller by swiftly and precisely tracking the MPP of the PV array in rapidly changing solar irradiance conditions
