

Finally spin motion is defined as a relative angular velocity about the common normal, viz.:

$$\Delta\omega_s = \omega_{s1} - \omega_{s2} = \Omega_{s1} - \Omega_{s2} \quad (1.7)$$

Any motion of contacting surfaces must satisfy the condition of continuous contact (1.4) and can be regarded as the combination of sliding, rolling and spin. For example, the wheels of a vehicle normally roll without slide or spin. When it turns a corner spin is introduced; if it skids with the wheels locked, it slides without rolling.

1.3 Forces transmitted at a point of contact

The resultant force transmitted from one surface to another through a point of contact is resolved into a normal force P acting along the common normal, which generally must be compressive, and a tangential force Q in the tangent plane sustained by friction. The magnitude of Q must be less than or, in the limit, equal to the force of limiting friction, i.e.

$$Q \leq \mu P \quad (1.8)$$

where μ is the coefficient of limiting friction. Q is resolved into components Q_x and Q_y parallel to axes Ox and Oy . In a purely sliding contact the tangential force reaches its limiting value in a direction opposed to the sliding velocity,

Fig. 1.2. Forces and moments acting on contact area S .

from which:

$$\left. \begin{aligned} Q_x &= -\frac{\Delta\omega_y}{|\Delta\omega|} \mu P \\ Q_y &= -\frac{\Delta\omega_x}{|\Delta\omega|} \mu P \end{aligned} \right\} \quad (1.9)$$

The force transmitted at a nominal point of contact has the effect of compressing deformable solids so that they make contact over an area of finite size. As a result it becomes possible for the contact to transmit a resultant moment in addition to a force (Fig. 1.2). The components of this moment M_x and M_y are defined as rolling moments. They provide the resistance to a rolling motion commonly called 'rolling friction' and in most practical problems are small enough to be ignored.

The third component M_z , acting about the common normal, arises from friction within the contact area and is referred to as the spin moment. When spin accompanies rolling the energy dissipated by the spin moment is combined with that dissipated by the rolling moments to make up the overall rolling resistance.

At this point it is appropriate to define *free rolling* ('*svetits rolling*' in the Russian literature). We shall use this term to describe a rolling motion in which spin is absent and where the tangential force Q at the contact point is zero. This is the condition of the unpowered and unbraked wheels of a vehicle if rolling resistance and bearing friction are neglected; it is in contrast with the driving wheels or braked wheels which transmit sizeable tangential forces at their points of contact with the road or rail.

1.4 Surface tractions

The forces and moments which we have just been discussing are transmitted across the contact interface by surface tractions at the interface. The normal traction (pressure) is denoted by p and the tangential traction (due to friction) by q , shown acting positively on the lower surface in Fig. 1.2. While nothing can be said at this stage about the distribution of p and q over the area of contact S , for overall equilibrium:

$$P = \int_S p \, dS \quad (1.10)$$

$$Q_x = \int_S q_x \, dS, \quad Q_y = \int_S q_y \, dS \quad (1.11)$$

With non-conforming contacts (including cylinders having parallel axes) the contact area lies approximately in the x - y plane and slight warping is neglected.
