Examples Of Chemical Engineering:

Scale-up in Chemical Engineering Marko Zlokarnik, 2003-01-30 A chemical engineer is generally concerned with the industrial implementation of processes in which chemical or microbiological conversion of material takes place in conjunction with the transfer of mass heat and momentum The characteristics of these processes depend on their scale They include heterogeneous chemical reactions and unit operations Understandably chemical engineers have always wanted to find ways of simulating these processes to gain insights assisting them while designing new industrial plants or trying to optimize existing plants Irrespective of whether the model involved represents a scale up or a scale down certain important questions always apply How small can the model be Is one model sufficient or should tests be carried out in models of different sizes When must or when can physical properties differ When must the measurements be carried out on the model with the original system of materials Which rules govern the adaptation of the process parameters in the model measurements to those of the full scale plant Is it possible to achieve complete similarity between the processes in the model and those in its full scale counterpart If not how should one proceed These questions touch on the fundamentals of the theory of models which are based on dimensional analysis Although they have been used in the field of fluid dynamics and heat transfer for more than a century cars aircrafts vessels and heat exchangers were scaled up according to these principles these methods have gained only a modest acceptance in chemical engineering This book attempts to fill this gap It is aimed at students and practicing chemical engineers It consists of two parts The first part presents the principles of dimensional analysis and of scale up based on it in an easily comprehensible and transparent manner These principles are illustrated by 23 examples concerning well known operations from the field of chemical engineering The second part of the book presents selected examples of treatment of processes in the field of mechanical 11 examples thermal 6 examples and chemical 5 examples process engineering by the dimensional analysis The last chapter shows that this method can also be favourably applied to the motion processes in the living world 5 examples leading to a better understanding of them *Chemical Engineering*

Catalog, 1919 **Computer Programming Examples for Chemical Engineers** George Ross, 1987 Written by a chemical engineer rather than by a computer scientist this book fills the gap between texts which teach computer languages or programming methods and chemical engineering texts which omit details of writing programs In order to write a computer program and get it to work general theoretical principles are not enough one has to actually do the job This is done in each case by first taking the reader through a manual calculation then presenting a computer program to perform the same task Explanation of how the program operates is given in some detail Topics discussed in this way include computer flowsheeting interpretation and accessing of results and physical data forward feed multi effect evaporation binary distillation linear programming introduction to finite differences with simple heat exchanger example steady state multi dimensional heat conduction unsteady state heat conduction solution of automatic control problems using finite differences In each case the

necessary theory is fully introduced The programs are written in BASIC an easily learnt moderately powerful language available on both mainframe and desk top computers
