Big Data Analytics Through SAS Cesar Perez, 2014-12-26 Big data analytics is the process of examining big data to uncover hidden patterns unknown correlations and other useful information that can be used to make better decisions With big data analytics data scientists and others can analyze huge volumes of data that conventional analytics and business intelligence solutions

can't touch. Consider this: it's possible that your organization could accumulate if it hasn't already billions of rows of data with hundreds of millions of data combinations in multiple data stores and abundant formats. High performance analytics is necessary to process that much data in order to figure out what's important and what isn't. Using big data analytics you can extract only the relevant information from terabytes, petabytes, and exabytes and analyze it to transform your business decisions for the future. Becoming proactive with big data analytics isn't a one-time endeavor; it is more of a culture change, a new way of gaining ground by freeing your analysts and decision makers to meet the future with sound knowledge and insight. SAS support for big data implementations including Hadoop through SAS and Hadoop is possible work in all steps of Analytical Process: Identify, formulate, Problem, Data Preparation, Data Exploration, Transform and select, Build Model, Validate model, Deploy Model, and Evaluate, Monitor Results. This book presents the work possibilities that SAS offers in the modern sectors of big data, Business Intelligence, and Analytics. The most important tools of SAS are presented for processing and analyzing large volumes of data in an orderly manner. In turn, these tools allow also extract the knowledge contained in the data.

BigData Analytics: Solution Or Resolution? Binayaka Mishra, 2017-06-26. In 1997, NASA researchers Michael Cox and David Ellsworth published "Application controlled demand paging for out of core visualization" in the Proceedings of the IEEE 8th conference on Visualization. They start the article with "Visualization provides an interesting challenge for computer systems: data sets are generally quite large, taxing the capacities of main memory, local disk, and even remote disk. We call this the problem of big data. When data sets do not fit in main memory in core or when they do not fit even on local disk, the most common solution is to acquire more resources. It is the first article in the ACM digital library to use the term 'big data'." Michael Lesk publishes "How much information is there in the world." Lesk concludes that "There may be a few thousand petabytes of information all told, and the production of tape and disk will reach that level by the year 2000. So in only a few years, as we will be able to save everything, no information will have to be thrown out and the typical piece of information will never be looked at by a human being."
