Principles of Fermentation Technology Juliana Lang, 2021-11-16 The metabolic process that produces chemical changes in organic substrates by the action of enzymes is referred to as fermentation It plays an important role in food production where it includes microorganisms for bringing desirable changes to a foodstuff or beverage Fermentation is the primary means of producing ATP within microorganisms through the degradation of organic nutrients anaerobically Some of the major products which are produced using the process of fermentation are ethanol lactic acid and hydrogen gas The procedures used within industrial fermentation are classified into batch and batch fed procedures The different ingredients are combined and the reactions proceed without any interference in the batch procedure During the fed batch procedure a few ingredients are added during the process of fermentation This book presents the complex subject of fermentation in the

most comprehensible and easy to understand language Different approaches evaluations and methodologies on fermentation have been included herein Experts and students actively engaged in this field will find this book full of crucial and unexplored concepts

Fermentation Technology Ray Medina,2019-05-21 Fermentation is the anaerobic conversion of sugar to carbon dioxide and alcohol by yeast or any group of chemical reactions induced by living or nonliving ferments that split complex organic compounds into relatively simple substances In fermentation a chemical change is brought on by the action of microscopic yeast molds and bacteria Fermentation is the process involving the biochemical activity of organisms during their growth development reproduction even senescence and death Fermentation technology is the use of organisms to produce food pharmaceuticals and alcoholic beverages on a large scale industrial basis The basic principle involved in the industrial fermentation technology is that organisms are grown under suitable conditions by providing raw materials meeting all the necessary requirements such as carbon nitrogen salts trace elements and vitamins The end products formed as a result of their metabolism during their life span are released into the media which are extracted for use by human being and that have a high commercial value The field of Fermentation Technology has been the science of many stormy developments in the past decade The major products of fermentation technology produced economically on a large scale industrial basis are wine beer cider vinegar ethanol cheese hormones antibiotics complete proteins enzymes and other useful products The aim of the book is to provide an in depth study of the principles of fermentation technology and recent advances and developments in the field of fermentation technology focusing on industrial applications

such as principles reaction kinetics scaling up of processes and applications The 20 chapters written by subject matter experts are divided into two parts Principles and Applications In the first part subjects covered include Modelling and kinetics of fermentation technology Sterilization techniques used in fermentation processes Design and types of bioreactors used in fermentation technology Recent advances and future prospect of fermentation technology The second part subjects covered include Lactic acid and ethanol production using fermentation technology Various industrial value added product biosynthesis using fermentation technology Microbial cyp450 production and its industrial application Polyunsaturated fatty acid production through solid state fermentation Application of oleaginous yeast for lignocellulosic biomass based single cell oil production Utilization of micro algal biomass for bioethanol production Poly lactide production from lactic acid through fermentation technology Bacterial cellulose and its potential impact on industrial applications

Fermentation Processes

Brycen Soto,2019-03-20 Fermentation is a metabolic process that consumes sugar in the absence of oxygen The products are organic acids gases or alcohol It occurs in yeast and bacteria and also in oxygen starved muscle cells as in the case of lactic acid fermentation The science of fermentation is known as zymology Fermentation process by which the living cell is able to obtain energy through the breakdown of glucose and other simple sugar molecules without requiring oxygen Fermentation is achieved by somewhat different chemical sequences in different species of organisms Two closely related paths of fermentation predominate for glucose When muscle tissue receives sufficient oxygen supply it fully metabolizes its fuel glucose to water and carbon dioxide Fermentation is a process which does not necessarily have to be carried out in an anaerobic environment For example even in the presence of abundant oxygen yeast cells greatly prefer fermentation to aerobic respiration as long as sugars are readily available for consumption a phenomenon known as the Crabtree effect The antibiotic activity of hops also inhibits aerobic metabolism in yeast The aim of the book is to provide an in depth study of the principles of fermentation technology and recent advances and developments in the field of fermentation technology focusing on industrial applications
