Design and Analysis of Experiments Douglas C. Montgomery, 1997 [Verification, Validation, and Testing of Engineered Systems](#) Avner Engel, 2010-11-19 Systems Verification Validation and Testing VVT are carried out throughout systems lifetimes Notably quality cost expended on performing VVT activities and correcting system defects consumes about half of the overall engineering cost Verification Validation and Testing of Engineered Systems provides a comprehensive compendium of VVT activities and corresponding VVT methods for implementation throughout the entire lifecycle of an engineered system In addition the book strives to alleviate the fundamental testing conundrum namely What should be tested How should one test When should one test And when should one stop testing In other words how should one select a VVT strategy and how it be optimized The book is organized in three parts The first part provides introductory material about systems and VVT concepts This part presents a comprehensive explanation of the role of VVT in the process of engineered systems Chapter 1 The second part describes 40 systems development VVT activities Chapter 2 and 27 systems

post development activities Chapter 3 Corresponding to these activities this part also describes 17 non testing systems VVT methods Chapter 4 and 33 testing systems methods Chapter 5 The third part of the book describes ways to model systems quality cost time and risk Chapter 6 as well as ways to acquire quality data and optimize the VVT strategy in the face of funding time and other resource limitations as well as different business objectives Chapter 7 Finally this part describes the methodology used to validate the quality model along with a case study describing a system s quality improvements Chapter 8 Fundamentally this book is written with two categories of audience in mind The first category is composed of VVT practitioners including Systems Test Production and Maintenance engineers as well as first and second line managers The second category is composed of students and faculties of Systems Electrical Aerospace Mechanical and Industrial Engineering schools This book may be fully covered in two to three graduate level semesters although parts of the book may be covered in one semester University instructors will most likely use the book to provide engineering students with knowledge about VVT as well as to give students an introduction to formal modeling and optimization of VVT strategy

Optimization of adaptive test design methods for the determination of steady-state data-driven models in terms of combustion engine calibration Sandmeier, Nino,2022-12-01 This thesis deals with the development of a model based adaptive test design strategy with a focus on steady state combustion engine calibration The first research topic investigates the question how to handle limits in the input domain during an adaptive test design procedure The second area of scope aims at identifying the test design method providing the best model quality improvement in terms of overall model prediction error To consider restricted areas in the input domain a convex hull based solution involving a convex cone algorithm is developed the outcome of which serves as a boundary model for a test point search A solution is derived to enable the application of the boundary model to high dimensional problems without calculating the exact convex hull and cones Furthermore different data driven engine modeling methods are compared resulting in the Gaussian process model as the most suitable one for a model based calibration To determine an appropriate test design method for a Gaussian process model application two new strategies are developed and compared to state of the art methods A simulation based study shows the most benefit applying a modified mutual information test design followed by a newly developed relevance based test design with less computational effort The boundary model and the relevance based test design are integrated into a multicriterial test design strategy that is tailored to match the requirements of combustion engine test bench measurements A simulation based study with seven and nine input parameters and four outputs each offered an average model quality improvement of 36 % and an average measured input area volume increase of 65 % compared to a non adaptive space filling test design The multicriterial test design was applied to a test bench measurement with seven inputs for verification Compared to a space filling test design measurement the improvement could be confirmed with an average model quality increase of 17 % over eight outputs and a 34 % larger measured input area Diese Arbeit befasst sich mit der Entwicklung

einer modellbasierten adaptiven Versuchsplanungsstrategie für die Anwendung in der Applikation des Stationärverhaltens von Verbrennungsmotoren Der erste Forschungsteil untersucht wie sich Grenzen im Eingangsraum in die Versuchsplanung eines adaptiven Prozesses einbinden lassen Ein weiterer Fokus liegt auf der Identifikation einer modellbasierten Versuchsplanung die eine bestmögliche Verbesserung der globalen Modellqualität hinsichtlich des Prädiktionsfehlers ermöglicht Es wird ein Grenzraummodell auf Basis der konvexen Hülle unter Zuhilfenahme eines Algorithmus zur Bestimmung eines konvexen Konus entwickelt das als Grundlage für eine Versuchsplanung in beschränkten Eingangsräumen verwendet wird Um die Anwendbarkeit bei hochdimensionalen Problemstellungen zu gewährleisten wird ein Verfahren vorgestellt das eine Berechnung auch ohne die Bestimmung der exakten konvexen Hülle und konvexen Konen ermöglicht Des Weiteren werden verschiedene Methoden zur datengetriebenen Modellbildung des Verbrennungsmotors verglichen wobei das Gauß Prozess Modell als die geeignetste Modellierungsmethode hervorgeht Um die bestmögliche Versuchsplanungsmethode bei der Anwendung des Gauß Prozess Modells zu ermitteln werden zwei neue Strategien entwickelt und mit verfügbaren Methoden aus der Literatur verglichen Eine simulationsbasierte Studie zeigt dass eine angepasste Mutual Information Methode die besten Ergebnisse liefert Ein neu entwickeltes relevanzbasiertes Verfahren erreicht die zweitbesten Ergebnisse bietet aber einen geringeren Berechnungsaufwand als das Mutual Information Verfahren Das Grenzmodell und das relevanzbasierte Verfahren werden in einem multikriteriellen Versuchsplanungsverfahren zusammengefasst das an die Anforderungen von Messungen an einem Verbrennungsmotorenprüfstand angepasst ist In einer simulationsbasierten Studie mit sieben bzw neun Eingangsparametern und jeweils vier Ausgängen konnte eine durchschnittliche Modellqualitätsverbesserung von 36 % und eine mittlere Vergrößerung des vermessenen Eingangsraumvolumens von 65 % im Vergleich zu einer nichtadaptiven raumfüllenden Versuchsplanung gezeigt werden Das multikriterielle Versuchsplanungsverfahren wurde anhand von Prüfstandsmessungen mit sieben Eingangsparametern verifiziert Im Vergleich zu einer raumfüllenden Versuchsplanung konnte eine mittlere Modellqualitätsverbesserung über alle acht Ausgänge von 17 % und ein um 34 % vergrößertes vermessenes Eingangsraumvolumen erreicht werden wodurch die Ergebnisse der Simulationen bestätigt werden konnten
