Low-cost Sensor Array Devices as a Method for Reliable Assessment of Exposure to Traffic-related Air Pollution Nataliya Mykhaylova, 2018 The exposure to air pollutant mixtures is a well known risk factor for inducing and increasing the severity of diseases Combining low cost sensors in arrays holds great potential for real time monitoring of pollutant exposure because of versatility and aptitude for tracking multi pollutant exposure While many low cost air pollution monitoring devices have been proposed several underexplored opportunities remain including sensor derived pollution indices source analysis and exposure assessment A thorough investigation of different low cost commercial gas and

particulate matter sensors from 5 manufacturers has been conducted and best performing sensors were identified A device for monitoring air quality has been developed and tested Each device consists of an array of commercially available metal oxide semiconductor for monitoring NO_x and O₃ CO CO₂ and optical sensors for monitoring PM_{2.5} Level of pollutant exposure has been characterized at different locations in Toronto over 3 different campaigns between 2013 and 2016 These deployments allowed long term sensor performance to be evaluated under different meteorological conditions as well as different ranges of pollutant concentrations Analysis of a large range of gas sensors revealed several key challenges including high intra sensor variability interference from temperature and nonlinearity Air quality health index estimation from sensor readings was successfully demonstrated Three aspects of device reproducibility were evaluated drift over time impact of interferences and impact of site specific mixtures Three categories of approaches for improving sensor accuracy and reproducibility were tested nonlinear calibration models variable transformations and training data selection Model reproducibility ability to adjust for multiple combinations of interferences and ability to resolve sites was improved when devices were calibrated at multiple sites Analysis showed that both short term and long term temporal patterns could be resolved and compared at different sites Background subtraction helped further emphasize the differences and rank sites in terms traffic related pollution

Sensors for Air Quality Monitoring Klaus Schäfer, Matthias Budde, 2025-06-04 Novel sensors to detect air pollutants like fine dust PM₁₀ PM_{2.5} O₃ NO₂ NO or CO as well as greenhouse gases like CO₂ are currently available and have been widely used for atmospheric and indoor air monitoring Although these sensors are small lightweight fast and cheap they can be relatively unstable and inaccurate To address these limitations further research is needed in the following areas possibilities and shortcomings of new sensing techniques and applications methodologies to overcome their disadvantages solutions to integrate networks of these sensors into existing well calibrated air quality monitoring networks solutions to use them for air quality monitoring and their application in new tasks such as the detection of air pollution hot spots or the evaluation of emission inventories and numerical air pollution simulations Environmental scientists including physicians chemists and epidemiologists play a vital role in defining the requirements for developing new sensors to detect harmful compounds in the atmosphere The detection of personal air pollution exposure and potentially personal pollen and fungi exposure in the future is close to being elucidated and will form the basis for enhanced measures to improve human health
