

CPSC 221: BASIC ALGORITHMS AND DATA STRUCTURES

Last Updated: September 19, 2008

Course Description

This course is an introduction to the design and analysis of basic data structures. It integrates topics in discrete mathematics and data structures, thereby providing a theoretical and practical foundation for many of our 3rd and 4th year computer science courses. The topics in this course are listed on the last page of this document.

Prerequisites CPSC 211, and one of CPSC 121 or MATH 220.

MATH 101 (or equivalent) is a corequisite, meaning that you either need to have credit for MATH 101 (or equivalent) or you have to take it concurrently. The department will enforce these prerequisites and corequisites. Equivalent credit for older versions of these courses (or appropriate transfer credits) will likely be acceptable.

Instructor William Evans (will@cs.ubc.ca), office: ICCS X841¹

Please limit e-mail to questions of a personal/confidential nature (e.g., sickness). The lectures, tutorials/labs, and bulletin board (also known as "Discussions" or "Discussion Group" on WebCT) are the right places to ask general questions. The bulletin board is read by all students in our lecture section, plus the TA's, and the instructor; so, a lot of us can respond to your questions. Students are encouraged to ask questions, and to respond to other students' questions, as long as the questions don't ask for answers to homework (theory or programming assignments).

TAs Landon Boyd (blandon@cs.ubc.ca) and Ashique KhudaBukhsh (ashique@cs.ubc.ca)

Plus there will be several markers assigned to this course.

Objects, Abstraction, Data Structures and Design Elliot B. Koffman, Paul A. T. Wolfgang, 2005-10-20 Koffman and Wolfgang introduce data structures in the context of C programming. They embed the design and implementation of data structures into the practice of sound software design principles that are introduced early and reinforced by 20 case studies. Data structures are introduced in the C STL format whenever possible. Each new data structure is introduced by describing its interface in the STL. Next one or two simpler applications are discussed, then the data structure is implemented following the interface previously introduced. Finally, additional advanced applications are covered in the case studies, and the cases use the STL. In the implementation of each data structure, the authors encourage students to perform a thorough analysis of the design approach and expected performance before actually undertaking detailed design and implementation. Students gain an understanding of why different data structures are needed, the applications they are suited for, and the advantages and disadvantages of their possible implementations. Case studies follow a five-step process: problem specification, analysis, design, implementation, and testing, that has been adapted to object-oriented programming. Students are encouraged to think critically about the five-step process and use it in their problem solutions. Several problems have extensive discussions of testing and include methods that automate the testing process. Some cases are revisited in later chapters, and new solutions are provided that use different data structures. The text assumes a first course in programming and is designed for Data Structures or the second course in programming, especially those courses that include coverage of OO design and algorithms. A C primer is provided for students who have taken a course in another programming language or for those who need a review in C. Finally, more advanced coverage of C is found in an appendix. Course Hierarchy: Course is the second course in the CS curriculum. Required of CS majors.
