

## Chapter 13 Lab **From DNA to Protein Synthesis**

---

### Problem

What are the steps involved in making a protein?

### Introduction

Before a protein can be built, the biochemical blueprints for its construction must be packaged and transferred out of the DNA “library.” First, the specific sequence of DNA that codes for the protein is transcribed into a complementary strand of mRNA. In eukaryotic cells, the mRNA then leaves the nucleus and enters the cytoplasm. In all cells, the mRNA molecule attaches to a ribosome, where tRNA anticodons translate the mRNA into amino acids. The completed amino acid chain, or polypeptide, then folds into its final shape as a protein.

In this lab, you will model transcription of DNA and translation of mRNA while you decode secret messages.

### Skills Focus

Use Models, Sequence

### Pre-Lab Questions

1. **Sequence** Describe briefly the process you will use to decode the messages.

---

---

---

2. **Compare and Contrast** What role do stop codons play in protein synthesis? What are they used for in the coded messages?

---

---

---

3. **Predict** Which six letters will not appear in the coded messages? Give a reason for your answer.
