**Asymptotic Statistics** A. W. van der Vaart, 2000-06-19 This book is an introduction to the field of asymptotic statistics. The treatment is both practical and mathematically rigorous. In addition to most of the standard topics of an asymptotics course including likelihood inference, M estimation, the theory of asymptotic efficiency, U statistics and rank procedures, the book also presents recent research topics such as semiparametric models, the bootstrap and empirical processes and their applications. The topics are organized from the central idea of approximation by limit experiments, which gives the book one of its unifying themes. This entails mainly the local approximation of the classical i.i.d. set up with smooth parameters by location experiments involving a single normally distributed observation. Thus even the standard subjects of asymptotic statistics are presented in a novel way. Suitable as a graduate or Master's level statistics text, this book will also give researchers an overview of research in asymptotic statistics.

**Asymptotics in Statistics** Lucien Le Cam, Grace Lo Yang, 2012-12-06 In the summer of 1968 one of the present authors LLC had the pleasure of giving a sequence of lectures at the University of Montreal. Lecture notes were collected and written out by Drs Catherine Doleans-Jean, Haezendonck and Roch Roy. They were published in French by the Presses of the University of Montreal as part of their series of *Seminaires de Mathematiques Superieures*. Twenty years later it was decided that a Chinese translation could be useful, but upon prodding by Professor Shanti Gupta at Purdue we concluded that the notes should be updated and rewritten in English and in Chinese. The present volume is the result of that effort. We have preserved the general outline of the lecture notes but we have deleted obsolete material and sketched some of the results acquired during the past twenty years. This means that while the original notes concentrated on the LAN situation, we have included here some results of Jeganathan and others on the LAMN case. Also included are versions of the Hajek-Le Cam asymptotic minimax and convolution theorems with some of their implications. We have not attempted to give complete coverage of the subject and have often stated theorems without indicating their proofs.

**Asymptotic Statistics** Reinhard Höpfner, 2014-05-26 This textbook is devoted to the general asymptotic theory of statistical experiments. Local asymptotics for statistical models in the sense of local asymptotic mixed normality or local asymptotic quadraticity make up the core of the book. Numerous examples deal with classical independent and identically distributed models and with stochastic processes. The book can be read in different ways according to possibly different mathematical preferences of the reader. One reader may focus on the statistical theory and thus on the chapters about Gaussian shift models, mixed normal and quadratic models, and on local asymptotics where the limit model is a Gaussian shift or a mixed normal or a quadratic experiment. LAN, LAMN, LAQ. Another reader may prefer an introduction to stochastic process models where given statistical results apply and thus concentrate on subsections or chapters on likelihood, ratio processes and some diffusion type models where LAN, LAMN or LAQ occurs. Finally, readers might put together both aspects. The book is suitable for graduate students starting to work in statistics of stochastic processes as well as for

researchers interested in a precise introduction to this area      **Asymptotic Theory of Statistics and Probability** Anirban DasGupta, 2008-03-07 This unique book delivers an encyclopedic treatment of classic as well as contemporary large sample theory dealing with both statistical problems and probabilistic issues and tools The book is unique in its detailed coverage of fundamental topics It is written in an extremely lucid style with an emphasis on the conceptual discussion of the importance of a problem and the impact and relevance of the theorems There is no other book in large sample theory that matches this book in coverage exercises and examples bibliography and lucid conceptual discussion of issues and theorems

reader is expected to have been exposed to statistical thinking and methodology as expounded for instance in the book by H Cramer 1946 or the more recent text by P Bickel and K Doksum 1977 Another possibility closer to the present in spirit is Ferguson 1967 Otherwise the reader is expected to possess some mathematical maturity but not really a great deal of detailed mathematical knowledge Very few mathematical objects are used their assumed properties are simple the results are almost always immediate consequences of the definitions Some objects such as vector lattices may not have been included in the standard background of a student of statistics For these we have provided a summary of relevant facts in the Appendix The basic structures in the whole affair are systems that Blackwell called experiments and transitions between them An experiment is a mathematical abstraction intended to describe the basic features of an observational process if that process is contemplated in advance of its implementation Typically an experiment consists of a set  $E$  of theories about what may happen in the observational process

This book begins with the fundamental large sample theory estimating ruin probability and ends by dealing with the latest issues of estimating the Gerber Shiu function This book is the first to introduce the recent development of statistical methodologies in risk theory ruin theory as well as their mathematical validities Asymptotic theory of parametric and nonparametric inference for the ruin related quantities is discussed under the setting of not only classical compound Poisson risk processes Cramér Lundberg model but also more general Lévy insurance risk processes The recent development of risk theory can deal with many kinds of ruin related quantities the probability of ruin as well as Gerber Shiu's discounted penalty function both of which are useful in insurance risk management and in financial credit risk analysis In those areas the common stochastic models are used in the context of the structural approach of companies default So far the probabilistic point of view has been the main concern for academic researchers However this book emphasizes the statistical point of view because identifying the risk model is always necessary and is crucial in the final step of practical risk management

There has been much demand for the statistical analysis of dependent observations in many fields for example economics engineering and the natural sciences A model that describes the probability structure of a series of dependent observations is called a stochastic process The primary aim of this book is to provide modern statistical techniques and theory for stochastic processes The stochastic processes mentioned here are not restricted to the usual autoregressive AR moving average MA and autoregressive moving average ARMA processes We deal with a wide variety of stochastic processes for example non Gaussian linear processes long memory processes nonlinear processes orthogonal increment processes and continuous time processes For them we develop not only the usual estimation and testing theory but also many other statistical methods and techniques such as discriminant analysis cluster analysis nonparametric methods higher order asymptotic theory in view of differential geometry large deviation principle and saddlepoint approximation Because it is d
