## **Residual Stresses In Cold Formed Steel Members:**

Computational Model of Cold-formed Steel Members Hamed Amouzegar, 2016 Post buckling behavior of thin walled cold formed steel members is complicated. The discrepancy between the experimentally measured load deformation curves and computational simulations stems from a fundamental lack of knowledge about the initial stage of these members such as residual stresses and strains and geometric imperfections. We develop a numerical algorithm to calculate the through thickness variation of residual stresses and strains. The algorithm calculates the stresses and strains by viewing the manufacturing process as a combination of elasto plastic bending and spring back in a wide plate under plane strain conditions. The results obtained via the proposed algorithm are verified with the available closed formed solutions, finite element analysis results and experimental measurements. A parametric study is performed to evaluate the effect of the coil radius and cross sectional and material properties on the residual stresses and strains. We also propose a framework for statistical analysis of the impact of global imperfection modes on collapse behavior of cold formed steel members. The measured global geometric imperfections of cold formed lipped channels are used within a stochastic fully nonlinear simulation framework to calculate an ensemble of load deformation curves as well as load carrying capacities describing in a statistical sense the collapse behavior of cold formed lipped channels. A robust analysis of variance ANOVA technique is finally used to examine the contribution of different imperfection modes in the variability present in the nonlinear response and to make quantitative conclusions on the impact of imperfection modes both individually and in groups on the collapse behavior.

Light Gauge Metal Structures Recent Advances Jacques Rondal, Dan Dubina, 2007-08-08 The aim of this book is to review recent research and technical advances including the progress in design codes related to the engineering applications of light gauge metal sections made in carbon high strength and stainless steel as well as aluminium alloys. Included is a review of the new technologies for connections of light gauge metal members. Main advanced applications for residential, non residential and industrial buildings and pallet rack systems are also covered. For the first time this book takes into account all the metallic materials now used more and more for structural components. The book will be of great interest not only for researchers but also for design engineers faced to the use of new metallic materials in modern structural applications.
