Surgical Robotics Serdar Küçük,2018-01-04 Robotic technology has increasingly been preferred by the medical professionals since they have been used for several clinical applications Medical robots are preferred since they present

better results compared to traditional methods such as smaller incision higher accuracy and lesser recovery time Medical robots can be divided into three progressive generations The first generation robots were originally industrial robots that had been modified for performing medical applications in orthopedics neurosurgery radiology and radiotherapy in the 1980s The second generation robots have been especially developed for executing surgical operations in the 1990s After the 2000s the third generation medical robots have been designed for performing difficult surgical and medical operations From the first approved surgical robot AESOP to the current da Vinci Surgical System there have been several different kinds of surgical robots produced until now Although the history of surgical robots is very short compared to the history of surgery thousands of surgical robots have been installed in hospitals worldwide and hundreds of thousands of people have been treated by these surgical robots Nowadays the achievements of the surgical robotics amaze both medical professionals and the patients It is noteworthy to follow up on the evolution of surgical robotics in the future

Urologic Robotic Surgery in Clinical Practice
Prokar Dasgupta, 2009-03-01

Robotics is one of the hottest topics in medicine today with an international interest that is exponentially growing The introduction of robotic technology into modern operating theatres has provoked a revolutionary change in the basic surgical approach with many advantages over traditional open surgical treatment including faster recovery and a significantly lower risk of surgical trauma While the benefits of minimally invasive surgery are apparent the expansion of laparoscopic surgery throughout the field has been relatively slow due to the steep learning curve and the level of practice and specialism required to perform such procedures Although revolutionary upon conception standard laparoscopy involves the surgeon working from monitors with no depth perception and also with a surgical motion that is counter intuitive The introduction of robotic technology however has surpassed the traditional laparoscopic approach by providing full three dimensional vision intuitive motion and wristed instrumentation with motion scaling These dramatic innovations have broadened the scope of surgeons that can now perform complex laparoscopy and while still in its infancy robotic assisted surgery has begun to infiltrate all fields of surgery However while the practical adoption of the techniques and procedures has increased over the last 5 years the educational resources have not leaving the only available learning tools as videos case observation and proctorships There is therefore a severe market void for such a publication as this with steadily growing sales around the world of robotic surgical systems A compact book overseen by such a respected figure and featuring contributions from the field leaders is sure to be very successful within the next few years
