### Example: Minimum Vertex Cover

- Here is a 2-approximation algorithm, given a graph  $G(V, E)$ :
  - let  $E' = E, C = \{\}$
  - while  $E'$  is nonempty:
    - pick an edge  $(u, v)$  from  $E'$  and add  $u$  and  $v$  to  $C$
    - remove any edge in  $E'$  that is connected to either  $u$  or  $v$
  - return  $C$

**Approximation Algorithms** Vijay V. Vazirani, 2013-03-14 Most natural optimization problems including those arising in important application areas are NP hard Therefore under the widely believed conjecture that  $P \neq NP$  their exact solution is prohibitively time consuming Charting the landscape of approximability of these problems via polynomial time algorithms therefore becomes a compelling subject of scientific inquiry in computer science and mathematics This book presents the theory of approximation algorithms This book is divided into three parts Part I covers combinatorial algorithms for a number of important problems using a wide variety of algorithm design techniques Part II presents linear programming based algorithms These are categorized under two fundamental techniques rounding and the primal dual schema Part III covers four important topics the first is the problem of finding a shortest vector in a lattice the second is the approximability of counting as opposed to optimization problems the third topic is centered around recent breakthrough results establishing hardness of approximation for many key problems and giving new legitimacy to approximation algorithms as a deep theory and the fourth topic consists of the numerous open problems of this young field This book is suitable for use in advanced undergraduate and graduate level courses on approximation algorithms An undergraduate course in algorithms and the theory of NP completeness should suffice as a prerequisite for most of the chapters This book can also be used as supplementary text in basic undergraduate and graduate algorithms courses [Approximation Algorithms for Combinatorial Optimization](#)

Klaus Jansen, Samir Khuller, 2003-07-31 This book constitutes the refereed proceedings of the Third International Workshop on Approximation Algorithms for Combinatorial Optimization Problems APPROX 2000 held in Saarbrücken Germany in September 2000 The 22 revised full papers presented together with four invited contributions were carefully reviewed and selected from 68 submissions The topics dealt with include design and analysis of approximation algorithms inapproximability results on line problems randomization techniques average case analysis approximation classes scheduling problems routing and flow problems coloring and partitioning cuts and connectivity packing and covering geometric problems network design and various applications *Combinatorial Optimization and Graph Algorithms*

Takuro Fukunaga, Ken-ichi Kawarabayashi, 2017-10-02 Covering network designs discrete convex analysis facility location and clustering problems matching games and parameterized complexity this book discusses theoretical aspects of combinatorial optimization and graph algorithms Contributions are by renowned researchers who attended NII Shonan meetings on this essential topic The collection contained here provides readers with the outcome of the authors research and productive meetings on this dynamic area ranging from computer science and mathematics to operations research Networks are ubiquitous in today's world the Web online social networks and search and query click logs can lead to a graph that consists of vertices and edges Such networks are growing so fast that it is essential to design algorithms to work for these large networks Graph algorithms comprise an area in computer science that works to design efficient algorithms for networks

Here one can work on theoretical or practical problems where implementation of an algorithm for large networks is needed. In two of the chapters recent results in graph matching games and fixed parameter tractability are surveyed. Combinatorial optimization is an intersection of operations research and mathematics especially discrete mathematics which deals with new questions and new problems attempting to find an optimum object from a finite set of objects. Most problems in combinatorial optimization are not tractable i.e. NP hard. Therefore it is necessary to design an approximation algorithm for them. To tackle these problems requires the development and combination of ideas and techniques from diverse mathematical areas including complexity theory, algorithm theory and matroids as well as graph theory, combinatorics, convex and nonlinear optimization and discrete and convex geometry. Overall the book presents recent progress in facility location, network design and discrete convex analysis.

All entries have been written by experts, while links to Internet sites that outline their research work are provided. The entries have all been peer reviewed. This defining reference is published both in print and on line.

[Proceedings of the Fourteenth Annual ACM-SIAM Symposium on Discrete Algorithms](#), 2003-01-01 From the January 2003 symposium come just over 100 papers addressing a range of topics related to discrete algorithms. Examples of topics covered include packing Steiner trees, counting inversions in lists, directed scale free graphs, quantum property testing and improved results for directed multicut. The papers were not formally refereed but attempts were made to verify major results.
