Programming Languages Design And Implementation:

   Programming Languages Terrence W. Pratt,Marvin V. Zelkowitz,1996 This text is designed to provide students with a broad and deep understanding of the major issues in both design and implementation of modern programming languages and a basic introduction to the underlying theoretical models on which these languages are based The emphasis throughout is on fundamental concepts students learn important ideas not minor language differences New to this edition are discussions of the major programming paradigms imperative procedural object based object oriented functional relational logic and parallel distributed as well as new languages SmallTalk C C Scheme Modula 2 Prolog Occam and Linda There is continued coverage of Ada Lisp Pascal and Fortran   **Principles of Programming Languages** Bruce J. Pratt,1975   *Programming Language Design and Implementation* Torben Ægidius Mogensen,2022 This concise textbook is intended as a guide for programming language designers and users to better help them understand consequences of design decisions The text aims to provide readers with an overview of the design space for programming languages and how design choices affect implementation It is not a classical compilers book as it assumes the reader is familiar with basic compiler implementation techniques nor is it a traditional comparative programming languages book because it does not go into depth about any particular language instead taking examples from a wide variety of programming languages to illustrate design concepts Readers are assumed to already have done at least a bit of programming in functional imperative and object oriented languages Topics and features Provides topic by topic coverage of syntax types scopes memory management and more Includes many technical exercises and discussion exercises Inspires readers to think about language design choices how these interact and how they can be implemented Covers advanced topics such as formal semantics and limits of computation Suitable for advanced undergraduates and beginning graduates this highly practical and useful textbook guide will also offer programming language professionals a superb reference and learning toolkit Torben gidius Mogensen is Associate Professor at the Dept of Computer Science at the University of Copenhagen Denmark   Foundations Of Programming Languages: Design And Implementation Seyed H. Roosta,2003 This text presents topics relating to the design and implementation of programming languages as fundamental skills that all computer scientists should possess Rather than provide a feature by feature examination of programming languages the author discusses programming languages organized by concepts   **Design and Implementation of Programming Languages** John H. pain points in your application domain by building a custom programming language Learn how to create parsers code generators file readers analyzers and interpreters Create an alternative to frameworks and libraries to solve domain specific problems Book Description The need for different types of computer languages is growing rapidly and developers prefer creating domain specific languages for solving specific application domain problems Building your own programming language has its advantages It can be your antidote to the ever increasing size and complexity of software In this book you ll start with implementing the frontend of a compiler for your language including a lexical analyzer and parser The book covers a series of traversals of syntax trees culminating with code generation for a bytecode virtual machine Moving ahead you ll learn how domain specific language features are often best represented by operators and functions that are built into the language rather than library functions We ll conclude with how to implement garbage collection including reference counting and mark and sweep garbage collection Throughout the book Dr Jeffery weaves in his experience of building the Unicon programming language to give better context to the concepts where relevant examples are provided in both Unicon and Java so that you can follow the code of your choice of either a very high level language with advanced features or a mainstream language By the end of this book you ll be able to build and deploy your own domain specific languages capable of compiling and running programs What you will learn Perform requirements analysis for the new language and design language syntax and semantics Write lexical and context free grammar rules for common expressions and control structures Develop a scanner that reads source code and generate a parser that checks syntax Build key data structures in a compiler and use your compiler to build a syntax coloring code editor Implement a bytecode interpreter and run bytecode generated by your compiler Write tree traversals that insert information into the syntax tree Implement garbage collection in your language Who this book is for This book is for software developers interested in the idea of inventing their own language or developing a domain specific language Computer science students taking compiler construction courses will also find this book highly useful as a practical guide to language implementation to supplement more theoretical textbooks Intermediate level knowledge and experience working with a high level language such as Java or the C language are expected to help you get the most out of this book **Polymorphic Programming Languages** David Michael Harland,1984 Programming Languages and System Architectures Jürg Gutknecht,1994 Programming languages and system architectures are at the frontiers of two different worlds The conference on which this book is based was an adventure in a land where the two worlds the formal world of algorithms and the physical world of electronic circuits interact The participants explored this land under the guidance of internationally renowned researchers such as Butler W Lampson Susan Graham Jan L A van de Snepscheut and C A R Hoare all of whom gave invited papers The volume includes these papers together with sixteen session papers Subjects of special interest include programing language design and history programming environments programming methods operating systems compiler construction and innovative system architectures PUBLISHER S
