Hybrid Solutions for the Modelling of Complex Environmental Systems Christian E. Vincenot, Stefano Mazzoleni, Lael Parrott, 2017-01-11 Systems studied in environmental science due to their structure and the heterogeneity of the entities composing them often exhibit complex dynamics that can only be captured by hybrid modeling approaches While several concurrent definitions of hybrid modeling can be found in the literature it is defined here broadly as the approach consisting in coupling existing modelling paradigms to achieve a more accurate or efficient representation of systems The need for hybrid models generally arises from the necessity to overcome the limitation of a single modeling technique in terms of structural flexibility capabilities or computational efficiency This book brings together experts in the field of hybrid modelling to demonstrate how this approach can address the challenge of representing the complexity of natural systems Chapters cover applied examples as well as modeling methodology

Complex Variables Stephen D. Fisher, 1999-02-16 Topics include the complex plane basic properties of analytic functions analytic functions as mappings analytic and harmonic functions in applications transform methods Hundreds of solved examples exercises applications 1990 edition Appendices

On Spatio-Temporal Data Modelling and Uncertainty Quantification Using Machine Learning and Information Theory Fabian Guignard, 2022-03-12 The gathering and storage of data indexed in space and time are experiencing unprecedented growth demanding for advanced and adapted tools to analyse them This thesis deals with the exploration and modelling of complex high frequency and non stationary spatio temporal data It proposes an efficient framework in modelling with machine learning algorithms spatio temporal fields measured on irregular monitoring networks accounting for high dimensional input space and large data sets The uncertainty quantification is enabled by specifying this framework with the extreme learning machine a particular type of artificial neural network for which analytical results variance estimation and confidence intervals are developed Particular attention is also paid to a highly versatile exploratory data analysis tool based on information theory the Fisher Shannon analysis which can be used to assess the complexity of distributional properties of temporal spatial and spatio temporal data sets Examples of the proposed methodologies are concentrated on data from environmental sciences with an emphasis on wind speed modelling in complex mountainous terrain and the resulting renewable energy assessment The contributions of this thesis can find a large number of applications in several research domains where exploration understanding clustering interpolation and forecasting of complex phenomena are of utmost importance

Random Field Solutions Including Boundary Condition Uncertainty for the Steady-state Generalized Burgers Equation Luc Huyse, 2001 CFD results are subject to considerable uncertainty associated with the operating conditions Even when the operational uncertainty is omitted under very controlled circumstances during wind tunnel experiments substantial disagreement between experimental and CFD results persists This discrepancy must be attributed to

model uncertainty This report discusses the various sources of uncertainty The need for advanced uncertainty modeling is illustrated by means of a computationally inexpensive 1 D Burgers equation model We specifically address the uncertainty due to missing variables inexact or incomplete differential equations To this extent a random field model is used for the viscosity and the fundamental differences between the solutions of the stochastic differential equations and a simple random variable model is highlighted The Burgers equation theoretically needs to be integrated over an infinite domain In a deterministic approach the integration domain is cut off at some far field boundary This truncation effectively ignores all variability outside this far field boundary We present a practical treatment for the uncertainty on the boundary conditions The results indicate that ignoring the boundary condition uncertainty dramatically underestimates the variance of the velocity $u(x)$ in the interior of the domain
