

Two-Dimensional Problems in Elasticity

3.1. INTRODUCTION

In the three previous chapters (1, 2, 3), the approaches to two-dimensional and the three-dimensional theory of applied elasticity are chosen. Further, the mechanics of materials or elementary theory (also known as structural theory) and the theory of elasticity. Both deal only on the conditions of equilibrium and make use of a balance of forces, stress, and strain that is usually considered as the associated with elastic materials. The essential difference between these methods lies in the extent to which the strain is described and in the type of simplifications employed.

The mechanics of materials approach uses an assumed deformation state to describe distortions in the body as a whole and hence yields the average stress as a unique tensor in given loading. Moreover, it usually treats separately each simple type of simple loading, for example, axial stress, bending, or torsion. Although of practical importance, the derivation of the mechanics of materials and their method for relatively simple problems and are derived on the basis of very restrictive assumptions. For the other hand, the method of elasticity does not only use a generalized deformation state, and deals with the general equations to be satisfied by a body in equilibrium under any external force system.

The theory of elasticity is preferred when critical design considerations such as maximum weight, minimum cost, or high reliability factors must be considered or when given requirements in limited load situations does not allow adequately to supply the desired requirements with one degree of accuracy. If properly applied, the theory of elasticity should yield solutions more closely approximating the actual distribution of stress, strain, and displacement.

Now, elasticity theory provides a check on the structures of the mechanics of materials solutions. The comparison, however, that both techniques yield are approximate solutions of stress, each of considerable value and each approximating the other.
