**Comprehensive Two-dimensional Gas Chromatography Time-of-flight Mass Spectrometry with Chemometric Analysis** Amanda Elizabeth Moses Sinha,2004 *Chemometric Analysis of Comprehensive Two-dimensional Liquid Chromatographic-diode Array Detection Data* Hope Patricia Bailey,2012 This research project sought to explore compare and develop chemometric methods with the goal of resolving chromatographically overlapped peaks though the use of spectral information gained from the four way data sets associated with comprehensive two dimensional liquid chromatography with diode array detection LC x LC DAD A chemometric method combining iterative key set factor analysis IKSFA and multivariate curve resolution alternating least squares MCR ALS was developed In the section of urine data analyzed over 50 peaks were found with 18 visually observable and 32 additional compounds found only after application of the chemometric method Upon successful chemometric resolution of chromatographically overlapped peaks accurate and precise quantification was then necessary Of the compared methods for quantification the manual baseline method was determined to offer the best precisions Of the 50 found peaks from the urine analysis 34 were successfully quantified using the manual baseline method with percent relative standard deviations ranging from 0.09 to 16 The accuracy of quantification was then investigated by the analysis of wastewater treatment plant effluent WWTP samples The chemometrically determined concentration of the unknown phenytoin sample was found to not exhibit a significant difference from the result obtained by the LC MS MS reference method and the precision of the IKSFA ALS method was better than that of the precision of the LC MS MS analysis Chromatographic factors data complexity large dynamic range retention time shifting chromatographic and spectral peak overlap and background removal were all found to affect the quantification results The last part of this work focused on rapid screening methods that were capable of locating peaks between samples that exhibited significant differences in concentration The aim here was to reduce the amount of data required to be resolved and quantified to only those peaks that were of interest This would then reduce the time required to analyze large complex samples by eliminating the need to first quantify all peaks in a given sample for many different samples Both the similarity index SI method and the Fisher ratio FR method were found to fulfill this requirement in a rapid means of screening fifteen wine samples *Comprehensive Chemometrics* Steven Brown,Roma Tauler,Beata Walczak,2020-05-26 *Comprehensive Chemometrics Second Edition Four Volume Set* features expanded and updated coverage along with new content that covers advances in the field since the previous edition published in 2009 Subject of note include updates in the fields of multidimensional and megavariate data analysis omics data analysis big chemical and biochemical data analysis data fusion and sparse methods The book follows a similar structure to the previous edition using the same section titles to frame articles Many chapters from the previous edition are updated but there are also many new chapters on the latest developments Presents integrated reviews of each chemical and biological method examining their merits and limitations through practical examples and extensive visuals

Advanced Chemometric Techniques for the Analysis of Complex Samples Using One- and Two-dimensional Gas Chromatography Coupled with Time-of-flight Mass Spectrometry Brooke C. Reaser,2017 Gas

chromatography is a powerful separation technique that alone and when coupled with mass spectrometric detection can provide detailed information regarding the chemical composition of complex mixtures. Advanced chemometric algorithms are often applied to the data generated from these gas chromatographic separations in order to glean additional meaningful information from large and complex data sets. This dissertation presents several research investigations conducted on the development, optimization, application, and study of several chemometric algorithms applied to one and two dimensional gas chromatography coupled with time of flight mass spectrometry (TOFMS). The two dimensional mass cluster method and principal component analysis (PCA) were applied to a non-targeted investigation of the stable isotope incorporation of metabolites present in the metabolome of the methylotrophic bacteria *Methylobacterium extorquens* AM1 using gas chromatography time of flight mass spectrometry (GC TOFMS). The area under the curve (AUC) of receiver operating characteristic (ROC) curves were used as quantitative metrics for the optimization of the tile based Fisher ratio method using diesel fuel spiked with native and non-native analytes using comprehensive two dimensional gas chromatography with time of flight mass spectrometry (GC GC TOFMS). This optimized algorithm was then applied to a process analytical chemistry (PAC) investigation into the source of catalyst yield reduction in an industrial polymerization plant. Finally, a GC TOFMS simulation based study determined the chemometric limit of resolution for deconvoluting analytes using multivariate curve resolution alternating least squares (MCR-ALS) and compared the results to expected theory surrounding the probability of peak overlap.

### **Advanced Chemometrics and Fundamental Considerations for Non-targeted Analysis with Comprehensive Multidimensional Gas Chromatography Coupled with Time-of-flight Mass Spectrometry** Sarah Elizabeth

Prebihalo, 2020. Comprehensive two dimensional gas chromatography (GCxGC) coupled with time of flight mass spectrometry (TOFMS) is a powerful analytical technique capable of separating complex mixtures providing valuable information about the chemical composition of samples. However, the inherent data density associated with three dimensional data provides a unique challenge to analytical chemists. As a result, significant effort has been invested in utilizing advanced chemometrics to glean meaningful information about samples from large and complex data sets. Herein, this dissertation introduces several investigations conducted on optimizing separation conditions to be amenable to chemometric deconvolution algorithms as well as the development, study, and application of advanced chemometric techniques applied to GCxGC TOFMS data. To begin, the metric trilinear deviation ratio (TDR) is utilized to study the impact of experimental parameters such as column selection and modulation period (PM) on the quantitative accuracy of parallel factor analysis (PARAFAC) deconvolution. TDR scales with increasing change in second dimension retention time ( $\Delta t_R$ ) associated with pseudo isothermal conditions on the second dimension (2D) and quantitative accuracy decreases as TDR increases. Two column sets were utilized with varying film thickness on the first column (1D) and each column set was studied using two PM for a total of 4 experiments. It was reported that using 1D columns with larger film thicknesses allows the analyst to employ a shorter PM in turn lowering the  $\Delta t_R$ .

leading to higher quantitative accuracy Many GCxGC TOFMS studies relate to identifying class distinguishing analytes and can be tedious when performed manually Fortunately the use of discovery based chemometric tools such as principal component analysis PCA and Fisher ratio F ratio analysis has increased in popularity as less time intensive and automated techniques for untargeted analyses To begin this dissertation will investigate mass channel purity obtained via the tile based F ratio algorithm using diesel fuel spiked with non native analytes using GCxGC TOFMS The F ratio algorithm considered a supervised discovery technique because class membership is known a priori was first used to discover the spiked non native analytes Then using a novel signal ratio S ratio algorithm the mass channel selectivity information output by the F ratio method was studied using three statistical metrics null distribution analysis p value and lack of fit LOF The result of this investigation revealed that a mass channel has a high likelihood of being pure when its p value and LOF are sufficiently low Finally F ratio analysis was applied to a dataset including patients with an anterior cruciate ligament ACL injury to discover potential biomarkers of post traumatic osteoarthritis PTOA post injury Standard F ratios are calculated by the between class variance divided by the sum of the within class variance scaling up as the between class variance increases and the within class variance remains sufficiently small However many biological studies involve significant biological variance 30% that may not be associated with disease state or injury severity etc Herein the standard tile based F ratio algorithm was modified to use only the within class variance associated with control samples It was expected that the control class contained less within class variance relative to the patient class due to the expectation that some patient samples would be associated with increased severity of injury or the presence of coexisting conditions Hit lists metabolites discovered via F ratio from standard F ratio and control normalized F ratio were studied and directly compared to establish a comprehensive metabolome of potential biomarkers for PTOA development post ACL injury Reported in this dissertation is a discussion on the complementary nature of standard and control normalized F ratio followed by demonstration of class distinguishing metabolites via PCA *Journal of Chromatography* ,2003 Dissertation Abstracts International ,2008 **American Laboratory** ,2006 **Two-Dimensional Liquid Chromatography** Oliver Jones,2020-07-13 This book addresses the growing interest in the field of two dimensional liquid chromatography 2DLC a powerful approach to increasing resolution available peak capacity and selectivity in analytical chromatography 2DLC is suitable for many applications including in the pharmaceutical and polymer industries and the omic sciences metabolomics lipidomics and proteomics Thanks to recent advances in technology and software the instrumentation needed to perform 2D LC is broadly available to the analytical community in both industry and academia Indeed the technique can now be considered ready for application in R D as well as in QA and QC labs yet it is not widely known about outside academic laboratories and is rarely taught at the undergraduate level This book outlines the main principles and features of 2D LC including comprehensive and heart cutting modes method development and real world applications to enable modern analysts to start using this fascinating technique

The book offers an ideal starting point for those wishing to get into 2D LC and will also be of interest to more experienced scientists in the field

Investigations Into Background Correction and Retention Time Alignment to Enhance Quantitative Chemometric Analysis of Comprehensive Two-dimensional Liquid Chromatography-diode Array Detection Data

Robert Craig Allen, 2012 The focus of the projects presented here was to develop possible solutions to three issues commonly encountered during chemometric analysis of comprehensive two dimensional liquid chromatography diode array detector LCxLC DAD data The focus of the first project was to determine a means of performing background correction that removed two background ridges The methods of simply subtracting out a mean blank sample singular value decomposition based background correction SVD BC and asymmetrically weighted least squares AWLS were compared AWLS was found to be the only background correction technique to fully remove the ridges However AWLS was also found to attenuate the peak intensity by approximately 25% due to over fitting of the background at the lower wavelengths The focus of the second project was the investigation of five common interpolation strategies for the reconstruction of the sampled first dimension peak The interpolation strategy that best reproduced the original first dimension retention time was Gaussian fitting This was expected given that the simulated data set was generated using a Gaussian model for the peak shape An algorithm semi automated alignment method SAAM was then developed that allowed for each peak to be aligned independently of the other peaks in the data set SAAM was validated using both simulated and experimental data The simulated results indicated that SAAM produced percent recoveries close to 100% SAAM was also compared to iterative key set factor analysis alternating least squares IKSFA ALS for the analysis of phenytoin in a waste water treatment plant effluent SAAM produced a concentration of 26.3 ppb compared to 39.9 ppb from IKSFA ALS While these results are very different the result produced by SAAM is still within the experimental error of the reference 2D LC M S MS method 42.19 Finally SAAM was compared to two existing literature methods A mixture of simulated and experimental data sets was used to measure the accuracy and precision of the results SAAM was found to be impacted less by intra and inter sample retention time shifting than PARAFAC2 SAAM and shifted candecomp PARAFAC were found to produce very similar results However SAAM was found to experience some difficulty producing accurate and precise results with some of the experimental data sets
