Stabilization and H^∞ Control of Switched Dynamic Systems Jun

Fu, Ruicheng Ma, 2020-09-24 This book presents several novel constructive methodologies for global stabilization and H_∞ control in switched dynamic systems by using the systems structure information. The main features of these new approaches are twofold: i) Novel Lyapunov functions are constructed and new switching strategies are designed to guarantee global finite time stabilization of the closed loop switched dynamic systems while ii) without posing any internal stability requirements on subsystems the standard H_∞ control problem of the switched dynamic systems is solved by means of dwell time switching techniques. Systematically presenting constructive methods for analyzing and synthesizing switched systems the content is of great significance to theoretical research and practical applications involving switched systems alike. The book provides a unified framework for stability analysis, stabilization and H_∞ control of switched systems making it a valuable resource for researchers and graduate students who want to learn about the state of the art in the analysis and synthesis of switched systems as well as recent advances in switched linear systems. In addition it offers a wealth of cutting edge constructive methods and algorithm designs for researchers who work with switched dynamic systems and graduate students of control theory and control engineering.

Nonlinear and Adaptive Control of Model Helicopter, 2006 A helicopter is a complex nonlinear system and also an under actuated system with fewer independent control actuators than degrees of freedom to be controlled making the control difficult. There is a growing interest in the modeling and control of such systems using nonlinear dynamic models and nonlinear control. Analytical techniques based on Lyapunov theory are then used to design the controller and still the design can become extremely complex. Hence the existing control methods use linearization techniques on the actual nonlinear dynamics of the plant and linear control techniques. The resulting performance may not be satisfactory especially when the system is subjected to unknown and sudden disturbances. In this thesis we present a new Nonlinear and Adaptive controller design which uses the actual nonlinear model of the helicopter and not a linearized version. The design methodology basically involves making the combined dynamics of the helicopter and the controller resemble the dynamics of a nonlinear time varying electrical circuit having the required properties using a process similar to reverse engineering. The circuit template in turn is formed from well defined time varying and or nonlinear electrical elements and using proper interconnections. The kind of elements used and the general form of the dynamics derived will depend upon the application. For example in the helicopter case the closed loop dynamics of the helicopter and the controller expressed in terms of the error variable should point to a NLTV circuit with only passive elements. For this the reactive elements should have their relaxation points the points where the stored energy is zero at and only at the origin. Also the stored energy should be monotonically increasing. We can bring in any knowledge including the structure that we have about the plant being controlled in enhancing the circuit.

System Identification for Control Design
Linda C. Rae, 1990 **Adaptive Control of Nonsmooth Dynamic Systems** Gang Tao, Frank L. Lewis, 2013-04-17 A

complete reference to adaptive control of systems with nonsmooth industrial nonlinearities such as backlash dead zones

component failure friction hysteresis saturation and time delays Actuator nonlinearities are ubiquitous in engineering practice and limit control system performance While standard feedback control alone cannot handle these nonsmooth nonlinearities effectively this book shows how such nonlinear characteristics can be compensated for by using adaptive and intelligent control techniques This allows desired system performance to be achieved in the presence of uncertain nonlinearities With surveys of literature and summaries of various design methods the contributors present new solutions to some important issues in adaptive control of systems with various sorts of nonsmooth nonlinearities The book motivates more research activities in the field of adaptive control of nonsmooth nonlinear industrial systems by formulating several challenging open problems in related areas

Nonlinear Control Design Riccardo Marino, 1995-01-01 Nonlinear Control Design presents a self contained introduction to nonlinear feedback control design for continuous time finite dimensional uncertain systems It deals with nonlinear systems affected by uncertainties such as unknown constant parameters time varying disturbances and uncertain nonlinearities Both state feedback and output feedback are addressed Differential geometric techniques are used to identify classes of nonlinear systems considered and to design feedback algorithms Adaptive versions of these controls are developed in the presence of unknown parameters while

robust versions are designed in the presence of time varying disturbances These control algorithms are applied to significant physical control problems from electric motor drives robotics aerospace power systems and are illustrated through worked examples The text is illustrated throughout with over 100 exercises more than 75 worked examples and 12 physical examples
