Driven by advances in electronically controlled systems for automobiles, the demand is growing for soft magnetic materials that can process a large electromagnetic flux with low eddy current losses, flux density with very low surface resistance, have been developed in combination of high DC electromagnetic properties such as high permeability and resistivity. This paper describes the recent development trends of soft magnetic steel and the achievement of one developed steel (ECC100) series.

Introduction

Recently automobiles are being heavily equipped with various systems operated electronically, electronically and/or electrohydraulically to control engine, gearbox and fuel economy. Such systems include integrated controlled automatic transmission, electronic power steering (EPS) and anti-lock braking systems (ABS)¹⁻³.

In the early years (1970s, 1980s) when electric and electronic devices started to be used in automobiles, the main purpose was to improve and upgrade the performance of individual systems. Highly complicated vehicles started to appear progressively, however, in steering, ABS, air-conditioning, engine and transmission, coordinated among different systems. Hence electronically and/or electrohydraulically controlled components are becoming increasingly important.

Among these electronically and/or electrohydraulically controlled systems, components that utilize electromagnetic force (permeable flux core) or their coils to generate magnetic fields, many conventional ones consist of low carbon steel, containing about 0.1% of carbon, to improve the response to control signals and increase energy efficiency.⁴ With the remarkable advancement of electromagnetic control in recent years, it has become essential to electronically components to have even higher performance and lower power consumption.

This paper describes the trend of soft magnetic materials, such as those for low carbon steel as electromagnetic components, and introduces the characteristics of the new, low-loss soft magnetic materials in the ECC100 Series Low Carbon Cold Chewing Sheet series developed by Nippon Steel.

by hydraulic control. This is a typical example of the electromagnetic components used in automobiles. Soft magnetic materials are usually used for low loss coils that are magnetically sensitive and for the bearings including cores.

Early solenoid devices for automobiles were mainly used for controlling the oil flow by small solenoids. Thus, the reliability and availability of low cost materials were more important than their magnetic characteristics. As a result, low carbon steels such as SAE1010, SAE1020, SAE1030 and SAE1040 (JIS-C 1008) were used for the solenoids.

Recent solenoid devices, however, must be able to control hydraulic media, and water. In solenoid coils, the small current is being replaced by larger current in many cases.^{5,6} On the lower current, the current density must be proportional to the grading force (electromagnetic force) of the low carbon, which increases with magnetic materials having low permeability (low permeability) at high flux density. The latest low loss steels maintain the same permeability as required to have magnetic characteristics better than those of SAE1030 (JIS-C 1030), making it difficult to use low carbon steel directly used for solenoid control, to satisfy the required characteristics of magnetic flux density and coercivity (Fig. 2).

In the mid-1990s, Nippon Steel started to actively research factors that can adversely affect the magnetic characteristics of soft magnetic materials and developed a soft magnetic material, ECC100, based on pure iron, which can achieve the best characteristics among all grades (99.997% minimum).⁷ The company has studied pure ferritic wiring in large power and pure ferritic flux line material is being widely used as a soft magnetic material for coil wiring.

In the late 1990s, there was an increasing demand for
