The boolean data type represents a logical value. It is used to store true or false values. The range of values that can be stored in a boolean is from 0 to 1. The boolean type is used to store logical values, such as the result of a comparison or a logical operation.

**Enum**  
The enum data type represents a set of named constants. It is used to store values that are limited to a specific set of options. The range of values that can be stored in an enum depends on the compiler and the platform. The enum type is used to store values that are limited to a specific set of options.

**Complex**  
The complex data type represents a complex number. It is used to store values that have both a real and an imaginary part. The range of values that can be stored in a complex depends on the compiler and the platform. The complex type is used to store complex numbers, such as those used in signal processing and physics.

**Pointer**  
The pointer data type represents the memory address of another variable. It is used to store the address of a variable, which can then be used to access the value stored at that address. The range of values that can be stored in a pointer depends on the compiler and the platform. The pointer type is used to store the address of a variable, which can then be used to access the value stored at that address.

**Array**  
The array data type represents a collection of elements of the same type. It is used to store multiple values of the same type. The range of values that can be stored in an array depends on the compiler and the platform. The array type is used to store multiple values of the same type.

**Vector**  
The vector data type represents a dynamic array. It is used to store a collection of elements of the same type. The range of values that can be stored in a vector depends on the compiler and the platform. The vector type is used to store a collection of elements of the same type.

**Map**  
The map data type represents a collection of key-value pairs. It is used to store a collection of data where each element is associated with a unique key. The range of values that can be stored in a map depends on the compiler and the platform. The map type is used to store a collection of data where each element is associated with a unique key.
