1. Consider the following program:

```
int x,y;
cin >> x >> y;
while(x!=0 && y!=0){
    if(x>y){
        x = x-y;
    }else if(x<y){
        y = y-x;
    }else y=0;
}
cout << x+y << endl;
```

What will this program print on the following inputs:

- a. 12 5
- b. 27 39
- c. -2 12
- d. 23 0

2. Write a function that takes as input a positive integer n and returns the n -th harmonic number. Reminder: the n -th harmonic number is equal to $1+(1/2)+(1/3)+(1/4)+\dots+(1/n)$

Solution:

Programming Language Concepts Peter Sestoft, 2017-08-31 This book uses a functional programming language F as a metalanguage to present all concepts and examples and thus has an operational flavour enabling practical experiments and exercises It includes basic concepts such as abstract syntax interpretation stack machines compilation type checking garbage collection and real machine code Also included are more advanced topics on polymorphic types type inference using unification co and contravariant types continuations and backwards code generation with on the fly peephole optimization This second edition includes two new chapters One describes compilation and type checking of a full functional language tying together the previous chapters The other describes how to compile a C subset to real x86 hardware as a smooth extension of the

previously presented compilers The examples present several interpreters and compilers for toy languages including compilers for a small but usable subset of C abstract machines a garbage collector and ML style polymorphic type inference Each chapter has exercises Programming Language Concepts covers practical construction of lexers and parsers but not regular expressions automata and grammars which are well covered already It discusses the design and technology of Java and C to strengthen students understanding of these widely used languages
